# MariaDB für Entwickler

## Agenda

1. Technical Background
    - Technical Structure
    - Process of Queries
2. Beispieldaten / Testserver
    - Sakila
    - Spendenliste
    - Server Vagrant
3. JOINS
    - Basics of Joins
    - Working with LEFT JOIN
    - Join examples
4. GROUP BY
    - Simple Group By Example
    - Join and group - example
5. CONSTRAINTS
    - Foreign Key Constraints - Example
    - Check constraint with example
6. UPDATE
    - Sophisticated Update
7. DELETE
    - Delete mit Transaktion
8. CONSTRAINTS
    - Constrains with Example Walkthrough
9. INDEX HINTS
    - Force use of an Index
    - Do not use an index if indexes are present
10. PREPARED STATEMENTS
    - Prepared Statements with examples
    - Prepared Statements and transactions
11. TRIGGERS
    - Triggers
12. EVENTS
    - Events
13. FUNCTIONS

- Functions with example

14. STORED PROCEDURES

    - Create Procedure
    - If
    - Cursors
    - Cursor with Params
    - Loop
    - Case
    - Cursor
    - Continue Handler Example
    - Exit Handler Example
    - Custom Error message

15. ERRORS

    - Error Codes List

16. LOCKS

    - Table wide locks
    - InnoDB Implicit Locks
    - SELECT FOR UPDATE

17. sys (Database included since MariaDB 10.6 AFAIK)

    - show innodb locks with sys

18. Formatierung Ausgaben / Funktionen

    - Datumsausgabe formatieren
    - Strings zusammenfügen

19. Partitions

    - Maintain Partitions and Explain

20. Performance

    - * vs. specific field in field list - select
    - Möglichst keine Funktion in where (spalte) verwenden
    - SQL-Rewrite Pager- Subselect

21. Analyzing Slow Queries / Indexes

    - Create unique index
    - Find indexes
    - Create Index/Delete/Drop Index
    - Indizes
    - Explain
    - profiling-get-time-for-execution-of.query
    - Kein function in where verwenden
    - Optimizer-hints (and why you should not use them)
    - Query-Plans aka Explains
    - Query Pläne und die Key-Länge
    - Index und Likes
    - Index und Joins
    - Find out cardinality without index

- Index and Functions
- Index neu aufbauen ?
- Index Stats

22. Tools

- Percona Toolkit
- pt-query-digest - analyze slow logs
- pt-online-schema-change howto
- Example sys-schema and Reference
- Profiling

23. Backup und Restore

- Backup und Restore

24. Tipps & Tricks

- Dummy table DUAL
- Wie kann ich verwendete Storage Engine rausfinden - Table
- SHOW VARIABLES WITH WHERE
- Schnellster Import von Daten mit csv
- Queries in Datenbank (mysql) loggen, die keine Indizes verwenden
- Workaround Materialized View
- Zeichensatz umstellen
- Hat InnoDB genug Speicher - Pages

25. Storage Engines

- MyISAM Key Buffer

26. References/Documentation

- MySQL/MariaDB Performance Document
- MariaDB - Changes in 10.6
- MariaDB - Installation Linux mit Repos
- JDBC-Treiber

27. Oracle

- Activating Oracle Sql-Mode
- Overview Oracle Mode
- When Others-Clause
- Demo Oracle sql_mode from MariaDB
- What is implemented in Oracle sql-mode - fromdual
- Simple oracle examples pl/sql in mariadb

## Backlog

1. Working with database objects

- Working with databases
- Working with tables
- Teststellung - Feld verkleinern

2. SELECT

- Select Beispiele
- Select Beispiele mit Like

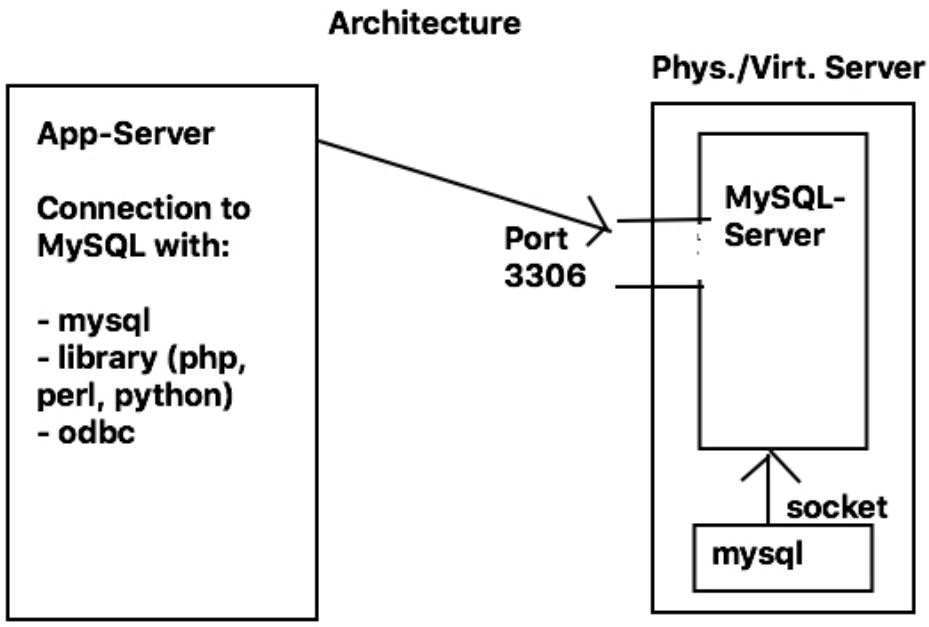
- SELECT ORDER BY
- Unterschiede einfache und doppelte Hochkommas bei Oracle/MySQL

3. INSERT/UPDATE
    - Praktisches Beispiel und erweitertes insert - INSERT
    - Praktisches Beispiel - Update
4. DELETE
    - Einfaches Delete Beispiel

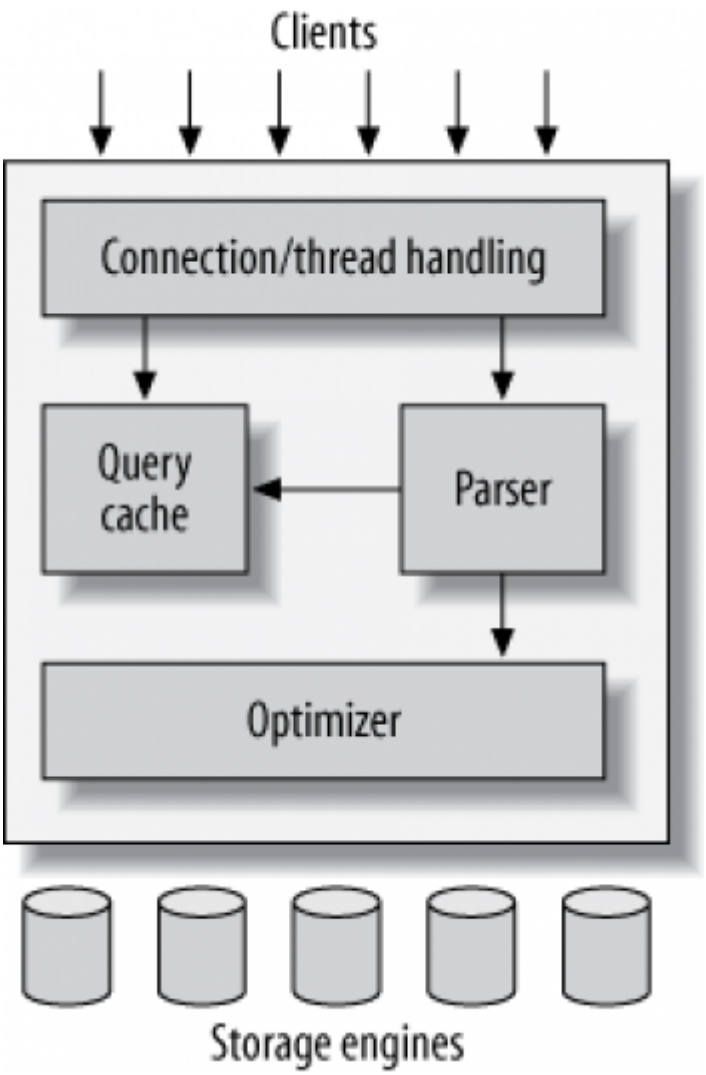
1. Datentypen
    - Integer - INT - Datentypen
2. Basics
    - Connection to DB + exit
    - mysql-client
    - Charset-Collations
    - server system variablen abfragen
3. Storage Engines
    - Which engine is used
4. Working with the data modelling language (DML's)
    - Working with INSERT
5. Tipps & Tricks / Do Not
    - Dump/SQL-File einspielen auf der Kommandozeile - Windows
6. Tools
    - HeidiSQL Portable - works for windows
7. Tipps & Tricks
    - Best Practice DBAL - Kochrezept
8. References
    - Examples Left Join
    - Notes on Specific MySQL Knowledge
    - Many Sakila Example Queries
    - Helpful Examples
9. Extra (Optional)
10. Übungen
    - Übung Update/Insert

## Technical Background

### Technical Structure



**Process of Queries**



## Beispieldaten / Testserver

### Sakila

```
cd /usr/src
wget https://downloads.mysql.com/docs/sakila-db.tar.gz
tar xzvf sakila-db.tar.gz

cd sakila-db
mysql < sakila-schema.sql
mysql < sakila-data.sql
```

### Spendenliste

### Walkthrough (Debian/Ubuntu 18.04. with mysql 5.7.)

- Complete process takes about 10 minutes

```
cd /usr/src;
apt update; apt install git;
git clone https://github.com/jmetzger/dedupe-examples.git;
cd dedupe-examples;
cd mysql_example;
## Eventually you need to enter (in mysql_example/mysql.cnf)
## Only necessary if you cannot connect to db by entering "mysql"
## password=<your_root_pw>
./setup.sh
```

### Walkthrough (Debian/Ubuntu 20.04. with mysql 8)

- Complete process takes about 10 minutes

```
cd /usr/src;
apt update; apt install git;
git clone https://github.com/jmetzger/dedupe-examples.git;
cd dedupe-examples;
cd mysql_example;
## otherwice script does not work
echo "set local_infile=1" | mysql
## Eventually you need to enter (in mysql_example/mysql.cnf)
## Only necessary if you cannot connect to db by entering "mysql"
## password=<your_root_pw>
./setup.sh
```

### Server Vagrant

```
## Put this in a Vagrantfile
## 1. mkdir project; cd project
## 2. Put this in a Vagrantfile
## 3. vagrant up
## 4. vagrant ssh

Vagrant.configure("2") do |config|

  config.vm.box = "ubuntu/focal64"
  config.vm.provision "shell", inline: <<-SHELL

    apt-get update
    apt-get install -y mysql-server-8.0 wget
    cd /usr/src
    wget https://downloads.mysql.com/docs/sakila-db.tar.gz
    tar xzvf sakila-db.tar.gz
    cd sakila-db
    mysql < sakila-schema.sql
    mysql < sakila-data.sql

    echo "-- Setting up external user"
    echo "CREATE USER ext@'%' identified by 'student'" | mysql
    echo "GRANT ALL PRIVILEGES ON *.* TO ext@'%'" | mysql

    echo "-- Setting mysql up for external access"
    echo "bind-address = 0.0.0.0" >> /etc/mysql/mysql.conf.d/mysqld.cnf
    systemctl restart mysql

    echo "-- Setting up contributions database - big data"
    cd /usr/src;
    apt-get install -y git
    git clone https://github.com/jmetzger/dedupe-examples.git;
    cd dedupe-examples;
    cd mysql_example;
    echo "set global local_infile = 1" | mysql
    echo "# Eventually you need to enter (in mysql_example/mysql.cnf)"
    echo '# Only necessary if you cannot connect to db by entering "mysql"'
    echo '# password=<your_root_pw>'
    ./setup.sh
    date
    echo "-- Done -  Setting up contributions database - big data"
  SHELL
end
```

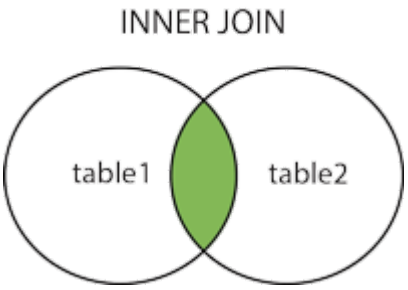
# JOINS

### Basics of Joins

### What is a JOIN for ?

- combines rows from two or more tables
- based on a related column between them.

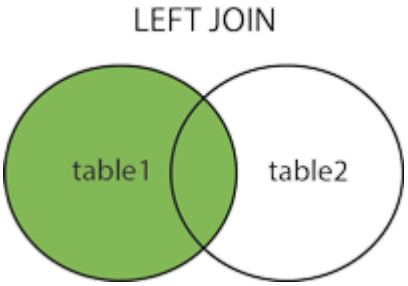
### MySQL (Inner) Join



### MySQL (Inner) Join (explained)

- Inner Join and Join are the same
- Returns records that have matching values in both tables
- Inner Join, Cross Join and Join
    - are the same in MySQL

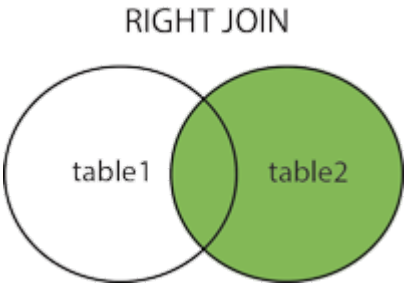
### MySQL Left Join



### MySQL Left (outer) Join (explained)

- Return all records from the left table
- *AND* the matched records from the right table
- The result is NULL on the right side
    - if there are no matched columns on the right
- Left Join and Left Outer Join are the same

### MySQL Right Join



### MySQL Right Join (explained)

- Return all records from the right table
  - *AND* the matched records from the left table
- Right Join and Right Outer Join are the same

### MySQL Straight Join

- MySQL (inner) Join and Straight Join are the same
- **Difference:**
  - The left column is always read first
- **Downside:**
  - Bad optimization through mysql (query optimizer)
- **Recommendation:**
  - Avoid straight join if possible
  - use join instead

### Type of Joins

- [inner] join
  - **inner join** and **join** are the same
- left [outer] join
- right [outer] join
- full [outer] join
- straight join < equals > join
- cross join = join (in mysql)
- natural join <= equals => join (but syntax is different)

### In Detail: [INNER] JOIN

- Return rows when there
  - is a match in both tables
- Example

```
SELECT actor.first_name, actor.last_name, film.title
FROM film_actor
INNER JOIN actor ON film_actor.actor_id = actor.actor_id
INNER JOIN film ON film_actor.film_id = film.film_id;
```

### In Detail: Joining without JOIN - Keyword ====

- Explanation: Will have the same query execution plan as [INNER] JOIN

```
SELECT actor.first_name, actor.last_name, film.title
FROM film_actor,actor,film
where film_actor.actor_id = actor.actor_id
and film_actor.film_id = film.film_id;
```

### In Detail: Left Join

- Return all rows from the left side
  - even if there is not result on the right side
- Example

```
SELECT
c.customer_id,
c.first_name,
c.last_name,
a.actor_id,
a.first_name,
a.last_name
FROM customer c
LEFT JOIN actor a
ON c.last_name = a.last_name
ORDER BY c.last_name;
```

### In Detail: Right Join

- Return all rows from the right side
  - even if there are no results on the left side
- Example

```
SELECT
c.customer_id,
c.first_name,
c.last_name,
a.actor_id,
a.first_name,
a.last_name
FROM customer c
RIGHT JOIN actor a
ON c.last_name = a.last_name
ORDER BY a.last_name;
```

### In Detail: Having

- Simple: WHERE for GroupBy (because where does not work here)
- Example

```
SELECT last_name, COUNT(*)
FROM sakila.actor
GROUP BY last_name
HAVING count(last_name) > 2
```

### Internal (type of joins) - NLJ

- NLJ - (Nested Loop Join)

```
for each row in t1 matching range {
for each row in t2 matching reference key {
for each row in t3 {
  if row satisfies join conditions, send to client
}
}
}
```

### Internal (type of joins) - BNL

- BNL - (Block Nested Loop)
  - in explain: -> using join buffer
  - columns of interest to a join are stored in join buffer
    - --> not whole rows.
  - join_buffer_size system variable
    - -> determines the size of each join buffer used to process a query.
- https://dev.mysql.com/doc/refman/5.7/en/nested-loop-joins.html

### BNL - Who can I see, if it is used ?

- Can be seen in explain

```
explain SELECT a.* FROM actor a  INNER JOIN actor b where a.actor_id > 20 and
b.actor_id < 20
```

```
When using a Block Nested-Loop Join, MySQL will, instead of automatically joining t2,
insert as many rows from t1 that it can into a join buffer
and then scan the appropriate range of t2 once,
matching each record in t2 to the join buffer.
From here, each matched row is then sent to the next join,
which, as previously discussed, may be another table,
t3, or, if t2 is the last table in the query,
the rows may be sent to the network.
```

### BNL's - Refs:

- https://www.burnison.ca/notes/fun-mysql-fact-of-the-day-block-nested-loop-joins

### Working with LEFT JOIN

### General

- Show all entries from the left table and only from the right if available
- Examples are based on sakila database.

### Example - new language / not in language table

```
SELECT @@foreign_key_checks;
SET FOREIGN_KEY_CHECKS=0
UPDATE film  SET language_id = 99 WHERE film_id >= 800 and film_id <= 899
SELECT f.film_id,f.title,f.description,l.name FROM film f LEFT JOIN language l ON
f.language_id = l.language_id;
SET FOREIGN_KEY_CHECKS=1
```

### Example

```
use sakila
SELECT
    c.customer_id,
    c.first_name,
    c.last_name,
    a.actor_id,
    a.first_name,
    a.last_name
FROM customer c
LEFT JOIN actor a
ON c.last_name = a.last_name
ORDER BY c.last_name;
```

### Join examples

```
## Work - step by step.
SELECT * FROM film f;
SELECT f.title FROM film f;
SELECT f.language_id FROM film f JOIN language l ON f.language_id = l.language_id;
-- aus film-tabelle alle felder - f.*
SELECT f.*,l.name FROM film f JOIN language l ON f.language_id = l.language_id;
SELECT f.film_id,f.title,l.name,f.description FROM film f JOIN language l ON
f.language_id = l.language_id;
```

# GROUP BY

### Simple Group By Example

```
## Variante 1
SELECT last_name,COUNT(last_name) as cnt FROM actor GROUP BY last_name

## Variante 2: ohne Group - akroyd zählen -> geht nur bei einem Namen
SELECT last_name,COUNT(last_name) as cnt FROM actor WHERE last_name = 'AKROYD'

## Das ist falsch - weil mehrere Namen, Ausgabe nur eine Zeile
SELECT last_name,COUNT(last_name) as cnt FROM actor WHERE last_name = 'AKROYD' or
last_name = 'ALLEN'

## Variante 2a (Erst Daten holen - 6 Datensätze, dann aggregieren (group by)
## Für grosse Datenmengen besser !
SELECT last_name,COUNT(last_name) as cnt FROM actor WHERE last_name = 'AKROYD' or
last_name = 'ALLEN' GROUP BY last_name
## Variante 2b (Alle Daten holen - 200 Datensätze, dann alles aggregieren)
SELECT last_name,COUNT(last_name) as cnt FROM actor GROUP BY last_name HAVING
last_name = 'AKROYD' or last_name = 'ALLEN'
```

### Join and group - example

## CONSTRAINTS

### Foreign Key Constraints - Example

### Walkthrough

#### Step 1: Sample Table and data

```
create table gadget_types(
    type_id int auto_increment,
    name varchar(100) not null,
    primary key(type_id)
);

insert into gadget_types(name)
values
    ('Entertainment'),
    ('Computing'),
    ('Communication'),
    ('Lifestyle'),
    ('Cameras');

create table gadgets(
    gadget_id int auto_increment,
    gadget_name varchar(100) not null,
    type_id int,
    primary key(gadget_id),
    constraint fk_type
    foreign key(type_id)
        references gadget_types(type_id)
);
```

### Step 2: Insert data to gadgets

```
insert into
    gadgets(gadget_name,type_id)
values
    ('Amazon Kindle',1),
    ('Apple iPod',1),
    ('Audio Highway Listen Up',1),
    ('Apple iPad',2),
    ('MicroSD',2),
    ('Apple iPhone',3),
    ('BlackBerry 6210',3),
    ('Pager',3),
    ('Air Taser Model 34000',4),
    ('Credit Card',4),
    ('Zippo',4),
    ('Casio G-Shock DW-5000C',4),
```

```
    ('Nikon F',5),
    ('Canon EOS 5D Mark II',5);
```

### Step 3 - Try to delete

```
delete from gadget_types
where type_id = 1;

SQL Error (1451): Cannot delete or update a parent row: a foreign key constraint fails
(`nation`.`gadgets`, CONSTRAINT `fk_type` FOREIGN KEY (`type_id`) REFERENCES
`gadget_types` (`type_id`))
--> To delete a row from the gadget_types table, you need to remove all the
referencing rows from the gadgets table first.
```

### Step 4 - Drop Contrains and set NULL Reference

```
alter table gadgets
drop constraint fk_type;

alter table gadgets
add constraint fk_type
foreign key(type_id)
    references gadget_types(type_id)
    on delete set null
    on update set null;

delete from gadget_types
where type_id = 1;

select * from gadgets;
--> As shown clearly from the output, the values in the type_id column of rows with
type_id 1 from the gadgets table were set to null because of the on delete set null
option.
```

### Step 5 - change id in gadget_types

```
update gadget_types
set type_id = 20
where type_id = 2;

select * from gadgets;

--> The values in the type_id column of rows with type_id 2 from the gadgets table
were set to null because of the on update set null option.
```

### Step 6 - remove orphans

```
delete from gadgets
where type_id is null;
```

### Step 7 - cascade reference option

```
-- Drop constraint
alter table gadgets
drop constraint fk_type;

alter table gadgets
add constraint fk_type
foreign key(type_id)
    references gadget_types(type_id)
    on delete cascade
    on update cascade;

delete from gadget_types
where type_id = 3;
--> MariaDB automatically deleted rows from the gadgets table whose type_id is 3
because of the on delete cascade action.

select * from gadgets;
```

### Step 8 - Update gadget_type id 4 to 40:

```
update gadget_types
set type_id = 40
where type_id = 4

--> MariaDB automatically updated rows from the gadgets table whose type_id is 4 to 40
because of the on update cascade action:
```

```
select * from gadgets;
--> Updated all references
```

### Ref:

- https://www.mariadbtutorial.com/mariadb-basics/mariadb-foreign-key/

### Check constraint with example

### Column constraints

```
create table classes(
    class_id int auto_increment,
    class_name varchar(255) not null,
    student_count int
        constraint positive_student_count
        check(student_count >0),
    primary key(class_id)
);
```

### Table Check Constraint

```
create table classes(
    class_id int auto_increment,
    class_name varchar(255) not null,
    student_count int,
    constraint positive_student_count
        check(student_count >0),
    primary key(class_id)
);

insert into classes(class_name, student_count)
values('MariaDB for Developers',0);

SQL Error (4025): CONSTRAINT `positive_student_count` failed for `nation`.`classes`

insert into classes(class_name, student_count)
values('MariaDB for Developers',100);
```

### Multi Column Constraint

```
create table classes(
    class_id int auto_increment,
    class_name varchar(100) not null,
    begin_date date not null,
    end_date date not null,
    student_count int,
    constraint positive_student_count
        check(student_count >0),
    constraint valid_date
        check(end_date >= begin_date),
    primary key(class_id)
);

-- Change structure like so
ALTER TABLE classes ADD (begin_date date NOT NULL, end_date date NOT NULL,
CONSTRAINT valid_date CHECK (end_date > begin_date))
```

```
--
```

**Ref:**

- https://www.mariadbtutorial.com/mariadb-basics/mariadb-check-constraint/

# UPDATE

## Sophisticated Update

## Aufgabe

```
Erhöhe bei allen Datensätzen in film die rental_rate um 1 Euro,
für die Schauspieler "actor", deren Nachname mit D anfängt
```

## Lösung

```
SELECT DISTINCT fc.film_id FROM filmcopy fc JOIN film_actor fa ON fc.film_id =
fa.film_id JOIN actor a ON fa.actor_id = a.actor_id where a.last_name like 'D%';

UPDATE filmcopy fc JOIN film_actor fa ON fc.film_id = fa.film_id JOIN actor a ON
fa.actor_id = a.actor_id SET rental_rate = rental_rate + 1
Query OK, 432 rows affected (0.02 sec)
Rows matched: 432  Changed: 432  Warnings: 0
```

# DELETE

## Delete mit Transaktion

## Beispiel

```
Variante 1: Andere sehen es erst nach commit (andere Sessions/Verbindungen)

BEGIN;
DELETE FROM actor where actor_id = 200;
COMMIT;

Variante 2: Aktion mir nicht, ich rolle sie zurück, mache sie rückgängig
BEGIN;
DELETE FROM actor where actor_id = 200;
ROLLBOCK;
```

## CONSTRAINTS

### Constrains with Example Walkthrough

## INDEX HINTS

### Force use of an Index

```
EXPLAIN SELECT Name,CountryCode FROM City FORCE INDEX (Name)
WHERE name>="A" and CountryCode >="A";
```

```
EXPLAIN SELECT Name,CountryCode FROM City USE INDEX (Name)
WHERE name>="A" and CountryCode >="A";
```

### Do not use an index if indexes are present

```
SELECT * FROM actor USE INDEX() WHERE last_name LIKE 'D%';
-- Identify if really no index is used
EXPLAIN SELECT * FROM actor USE INDEX() WHERE last_name LIKE 'D%';
```

# PREPARED STATEMENTS

### Prepared Statements with examples

### Setup

```
CREATE TABLE test (id int auto_increment, data varchar(40) NOT NULL DEFAULT '',
PRIMARY KEY(id));
```

### Single Line (Insert)

```
USE sakila;
PREPARE st1 FROM 'INSERT INTO actor (first_name,last_name) VALUES (?,?)';
SET @first_name = 'Johan';
SET @last_name = 'Muster';
EXECUTE st1 USING @first_name,@last_name;
DEALLOCATE PREPARE st1;

SELECT * FROM actor ORDER BY actor_id DESC;
```

### Multiline Prepared Statement (Insert)

```
-- Statement vorbereiten
PREPARE stmt1 FROM 'INSERT INTO test (data) VALUES (?), (?), (?)';
SET @d1 = 'Line1';
SET @d2 = 'Line2';
SET @d3 = 'Line3';
EXECUTE stmt1 USING @d1, @d2, @d3;

-- If you do not want to use it anymore DEALLOCATE IT
DEALLOCATE PREPARE stmt1;

SELECT * from test;
```

### Using it with select

```
create table t1 (a int,b char(10));
insert into t1 values (1,"one"),(2, "two"),(3,"three");
prepare test from "select * from t1 where a=?";
set @param=2;
execute test using @param;
+------+------+
| a    | b    |
+------+------+
|    2 | two  |
+------+------+
set @param=3;
execute test using @param;
+------+-------+
| a    | b     |
```

```
+------+-------+
|    3 | three |
+------+-------+
deallocate prepare test;
```

### Finding out number of rows (for select)

```
-- If this function is executed immediately after execute.
SELECT FOUND_ROWS();
```

### Prepared Statements and transactions

```
use sakila;
create table test if not exists (id int auto_increment, data varchar(30), primary
key(id));

START TRANSACTION;
PREPARE stmt2 FROM 'INSERT INTO test (`data`) VALUES (?)';
SET @d1 = 'Line1';
EXECUTE stmt2 USING @d1;
SET @d1 = 'Line2';
EXECUTE stmt2 USING @d1;
COMMIT;

SELECT * from test;

BEGIN;
SET @d1 = 'Line3 -uncommited';
EXECUTE stmt2 USING @d1;
ROLLBACK;

DEALLOCATE PREPARE stmt2;
SELECT * FROM test;
```

### References

- https://mariadb.com/kb/en/prepare-statement/

# TRIGGERS

### Triggers

### Create the structure

```
create table countries (
    country_id int auto_increment,
    name varchar(50) not null,
    primary key(country_id)
);

INSERT INTO countries (name) values ('Germany'), ('Austria');

create table country_stats(
    country_id int,
    year int,
    population int,
    primary key (country_id, year),
    foreign key(country_id)
    references countries(country_id)
);

INSERT INTO country_stats (country_id, year, population) values (1,2020,100000);

create table population_logs(
    log_id int auto_increment,
    country_id int not null,
    year int not null,
    old_population int not null,
    new_population int not null,
    updated_at timestamp default current_timestamp,
    primary key(log_id)
);
```

### Create the trigger

```
create trigger before_country_stats_update
    before update on country_stats
    for each row
    insert into population_logs(
        country_id,
        year,
        old_population,
        new_population
    )
    values(
        old.country_id,
        old.year,
        old.population,
```

```
        new.population
    );
```

## Create trigger (the same) but with BEGIN/END - Block

```
create trigger before_country_stats_update
    before update on country_stats
    for each row

    BEGIN
    SET @anfang = 1;
    insert into population_logs(
        country_id,
        year,
        old_population,
        new_population
    )
    values(
        old.country_id,
        old.year,
        old.population,
        new.population
    );
    END
```

### Run a test

```
update
    country_stats
set
    population = 1352617399
where
    country_id = 1 and
    year = 2020;

-- what's the new result

select * from population_logs;
```

### Ref:

- https://mariadb.com/kb/en/trigger-overview/

# EVENTS

### Events

### Preparation

```
-- scheduler is not there
SHOW PROCESSLIST;

-- Prüfen ob scheduler läuft
show variables like '%event%';
set GLOBAL event_scheduler = on;

-- scheduler appears
SHOW PROCESSLIST;

-- Events anzeigen
show events;
```

### preparation

```

USE schulung;
CREATE TABLE messages (
    id INT PRIMARY KEY AUTO_INCREMENT,
    message VARCHAR(255) NOT NULL,
    created_at DATETIME NOT NULL
);
```

### One time event

```
USE schulung
CREATE EVENT IF NOT EXISTS test_event_01
ON SCHEDULE AT CURRENT_TIMESTAMP
DO
  INSERT INTO messages(message,created_at)
  VALUES('Test MariaDB Event 1',NOW());

SELECT * FROM messages;
```

### Show all events from a specific database

```

SHOW EVENTS FROM schulung;
```

### Show all events in active database

```
USE schulung;
SHOW EVENTS;
```

### One time event but preserved (so runs once every minute)

```
To keep the event after it is expired, you use the  ON COMPLETION PRESERVE clause.

CREATE EVENT test_event_02
ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL 1 MINUTE
ON COMPLETION PRESERVE
DO
   INSERT INTO messages(message,created_at)
   VALUES('Test MariaDB Event 2',NOW());
```

### Same version, but with begin end block

```
DELIMITER /
CREATE EVENT test_event_03
ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL 1 MINUTE
ON COMPLETION PRESERVE
DO
   BEGIN
   INSERT INTO messages(message,created_at)
   VALUES('Test MariaDB Event 3',NOW());
   END /
DELIMITER ;

SELECT * FROM messages;
```

### Recurring Example

```
CREATE EVENT test_event_03
ON SCHEDULE EVERY 1 MINUTE
STARTS CURRENT_TIMESTAMP
ENDS CURRENT_TIMESTAMP + INTERVAL 1 HOUR
DO
   INSERT INTO messages(message,created_at)
   VALUES('Test MariaDB recurring Event',NOW());

SELECT * FROM messages;

// after 1 minute
SELECT * FROM messages;
```

### Drop an event

```
DROP EVENT IF EXIST test_event_03;
```

### Set event-scheduler in config / my.cnf / my.ini

```
[mysqld]
event-scheduler

## after that restawrt
systemctl restart mariadb
```

### Fix timezone problem Linux (when time is displayed wrong)

```
## 09:32 UTC should be 11:32 CEST
## also root ausführen
timedatectl list-timezones  | grep 'Europe/Berlin';
timedatectl set-timezone Europe/Berlin
timedatectl
date
systemctl restart mariadb
mysql
mysql>select now();
mysql>--- time should ok now
```

# FUNCTIONS

### Functions with example

### Example 1

```
CREATE FUNCTION hello (s CHAR(20))
    RETURNS CHAR(50) DETERMINISTIC
    RETURN CONCAT('Hello, ',s,'!');
```

### Example 2

```
DELIMITER //

CREATE FUNCTION CalcValue ( starting_value INT )
RETURNS INT DETERMINISTIC

BEGIN

   DECLARE total_value INT;

   SET total_value = 0;

   label1: WHILE total_value <= 3000 DO
     SET total_value = total_value + starting_value;
   END WHILE label1;

   RETURN total_value;

END; //

DELIMITER ;

-- Use it
SELECT CalcValue (1000);
```

### Example 3 (Mit Variable anzahl vorher setzen)

```
DELIMITER /

CREATE DEFINER=`ext`@`%` FUNCTION `Anzahl`(
    `starting_value` INT
)
RETURNS INT

BEGIN

   DECLARE total_value INT;
   DECLARE anzahl INT;
   -- SET total_value = 0;
   SELECT COUNT(*) INTO anzahl FROM actor;
```

```
   -- WHILE total_value <= 3000 DO
   --  SET total_value = total_value + starting_value;
   -- END WHILE;

   -- RETURN total_value;
   RETURN anzahl;

END/
```

### Example 3 (Direkt in @anzahl schreiben)

```
DELIMITER /

CREATE DEFINER=`ext`@`%` FUNCTION `schaupieler`(
    `starting_value` INT
)
RETURNS INT

BEGIN

   DECLARE total_value INT;
   SELECT COUNT(*) INTO @anzahl FROM actor;
   RETURN @anzahl;

END/
```

# STORED PROCEDURES

## Create Procedure

## Example

```
USE sakila;
DELIMITER //

CREATE PROCEDURE simpleproc (OUT param1 INT)
 BEGIN
  SELECT COUNT(*) INTO param1 FROM actor;
 END;
//

DELIMITER ;

CALL simpleproc(@a);

SELECT @a;
+-------+
| @a    |
+-------+
|     1 |
+-------+
```

## Reference

- https://mariadb.com/kb/en/create-procedure/

### If

### Example 1

```
-- Gibt 1 aus
-- SELECT werden auf dem Bildschirm angezeigt ;o)

DELIMITER $$
USE sakila $$
DROP PROCEDURE IF EXISTS my_sproc $$
CREATE PROCEDURE
my_sproc ()
BEGIN
   IF 1=1
   THEN
     SELECT 1;
   END IF;
END $$

CALL my_sproc
```

### Example 2

```
DELIMITER $
CREATE PROCEDURE my_pr()
BEGIN
IF 2 = 2 THEN
SELECT 'TRUE';
ELSE
SELECT 'FALSE';
END IF;
END $
DELIMITER ;
CALL my_pr;
```

### Example 3

```
DELIMITER /
CREATE OR REPLACE PROCEDURE addActor (IN startdate DATE, IN enddate DATE)
main: BEGIN
   IF startdate > enddate
   THEN
      SELECT 'Das Startdaum liegt nach dem Enddatum';
      LEAVE main;
    END IF;

    SELECT 'das passt';

END/
DELIMITER ;
```

### Reference

### Cursors

### Example 1:

```
CREATE DATABASE IF NOT EXISTS training;
USE training;

CREATE TABLE c1(i INT);

CREATE TABLE c2(i INT);

CREATE TABLE c3(i INT);

DELIMITER //

CREATE PROCEDURE p1()
BEGIN
  DECLARE done INT DEFAULT FALSE;
  DECLARE x, y INT;
  DECLARE cur1 CURSOR FOR SELECT i FROM c1;
  DECLARE cur2 CURSOR FOR SELECT i FROM c2;
  DECLARE CONTINUE HANDLER FOR NOT FOUND SET done = TRUE;

  OPEN cur1;
  OPEN cur2;

  read_loop: LOOP
    FETCH cur1 INTO x;
    FETCH cur2 INTO y;
    IF done THEN
      LEAVE read_loop;
    END IF;
    IF x < y THEN
      INSERT INTO c3 VALUES (x);
    ELSE
      INSERT INTO c3 VALUES (y);
    END IF;
  END LOOP;

  CLOSE cur1;
  CLOSE cur2;
END; //

DELIMITER ;

INSERT INTO c1 VALUES(5),(50),(500);
INSERT INTO c2 VALUES(10),(20),(30);

CALL p1;
SELECT * FROM c3;
```

### Example 2

```
CREATE OR REPLACE PROCEDURE getActorNames(p_ab CHAR(1))
BEGIN
  DECLARE d_full_name VARCHAR(90);
  DECLARE done INT DEFAULT FALSE;
  DECLARE cur1 CURSOR FOR SELECT CONCAT(last_name,',',first_name) FROM actor where
last_name LIKE CONCAT(p_ab,'%');
  DECLARE CONTINUE HANDLER FOR NOT FOUND SET done = TRUE;

  OPEN cur1;
  read_loop: LOOP
    FETCH cur1 INTO d_full_name;

    IF done THEN
      LEAVE read_loop;
    ELSE
        INSERT INTO actorlog (full_name) values (d_full_name);
      END IF;
  END LOOP;

  CLOSE cur1;
END; //

DELIMITER ;

CALL getActorNames('B');
SELECT * FROM actorlog;
```

### Example 3

```
USE sakila;
-- DROP TABLE IF EXISTS actor_stats;
CREATE TABLE IF NOT EXISTS actor_stats(id INT auto_increment, last_name VARCHAR (90),
howmany TINYINT, UNIQUE (last_name), primary key(id));

CREATE OR REPLACE PROCEDURE writeActorStats()
BEGIN
  DECLARE d_last_name VARCHAR(45);
  DECLARE done INT DEFAULT FALSE;
  DECLARE c_actors CURSOR FOR SELECT last_name FROM actor;
  DECLARE CONTINUE HANDLER FOR NOT FOUND SET done = TRUE;
  DECLARE CONTINUE HANDLER FOR 1062
  BEGIN
    UPDATE actor_stats SET howmany = howmany + 1 WHERE last_name = d_last_name;
  END;

  TRUNCATE actor_stats;

  OPEN c_actors;
```

```
  read_loop: LOOP
    FETCH c_actors INTO d_last_name;

    IF done THEN
      LEAVE read_loop;
    ELSE
        INSERT INTO actor_stats (last_name,howmany) values (d_last_name,1);
    END IF;
  END LOOP;

  CLOSE c_actors;
END; //

DELIMITER ;

CALL writeActorStats();
SELECT * FROM actor_stats;
SELECT * FROM actorlog;
```

### Continue Handler Example

### Example 1 (Handler without begin end)

```
-- In heidisql

DELIMITER /
CREATE OR REPLACE PROCEDURE handlertest()
BEGIN
  DECLARE CONTINUE HANDLER FOR 1146
    SELECT 'Sorry mate, wrong table';

  SELECT actor_id FROM wrong_table_name;
  SELECT 'continue';
  SELECT * FROM actor WHERE actor_id = 1;

END /
```

```
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
select
MariaDB [sakila]> CALL handlertest;
+--------------------------+
| Sorry mate, wrong table |
+--------------------------+
| Sorry mate, wrong table |
+--------------------------+
1 row in set (0.001 sec)

+----------+
| continue |
+----------+
| continue |
+----------+
1 row in set (0.001 sec)

+----------+------------+-----------+
| actor_id | first_name | last_name |
+----------+------------+-----------+
|        1 | PENELOPE   | GUINESS   |
+----------+------------+-----------+
1 row in set (0.003 sec)

Query OK, 0 rows affected (0.003 sec)

MariaDB [sakila]>
```

### Example 2: with begin and end (handler)

```
-- Important: At the end of th BEGIN END; block for DECLARE CONTINUE ..
-- There has to be an ";" at then end of END -> END;
```

```
DELIMITER /
CREATE OR REPLACE PROCEDURE handlertest()
BEGIN
  DECLARE CONTINUE HANDLER FOR 1146
  BEGIN
     SELECT 'Sorry mate, wrong table';
  END;

  SELECT actor_id FROM wrong_table_name;
  SELECT 'continue';
  SELECT * FROM actor WHERE actor_id = 1;

END /
```

```
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
select
MariaDB [sakila]> CALL handlertest;
+--------------------------+
| Sorry mate, wrong table |
+--------------------------+
| Sorry mate, wrong table |
+--------------------------+
1 row in set (0.001 sec)

+----------+
| continue |
+----------+
| continue |
+----------+
1 row in set (0.001 sec)

+----------+------------+-----------+
| actor_id | first_name | last_name |
+----------+------------+-----------+
|        1 | PENELOPE   | GUINESS   |
+----------+------------+-----------+
1 row in set (0.003 sec)

Query OK, 0 rows affected (0.003 sec)

MariaDB [sakila]>
```

### Exit Handler Example

### Example 1 (Handler without begin end)

```
-- In heidisql

DELIMITER /
CREATE OR REPLACE PROCEDURE handlertest()
BEGIN
  DECLARE EXIT HANDLER FOR 1146
    SELECT 'Sorry mate, wrong table';

  SELECT actor_id FROM wrong_table_name;
  SELECT 'continue';
  SELECT * FROM actor WHERE actor_id = 1;

END /
```

```
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
select
MariaDB [sakila]();
+-------------------------+
| Sorry mate, wrong table |
+-------------------------+
| Sorry mate, wrong table |
+-------------------------+
1 row in set (0.001 sec)

Query OK, 0 rows affected (0.002 sec)
```

### Example 2: with begin and end (handler)

```
-- Important: At the end of th BEGIN END; block for DECLARE CONTINUE ..
-- There has to be an ";" at then end of END -> END;

DELIMITER /
CREATE OR REPLACE PROCEDURE handlertest()
BEGIN
  DECLARE EXIT HANDLER FOR 1146
  BEGIN
     SELECT 'Sorry mate, wrong table';
  END;

  SELECT actor_id FROM wrong_table_name;
  SELECT 'continue';
  SELECT * FROM actor WHERE actor_id = 1;

END /
```

```
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
select
MariaDB [sakila]();
+-------------------------+
| Sorry mate, wrong table |
+-------------------------+
| Sorry mate, wrong table |
+-------------------------+
1 row in set (0.001 sec)

Query OK, 0 rows affected (0.002 sec)
```

### Custom Error message

### Variante 1

```
USE `sakila`;
DROP PROCEDURE IF EXISTS actortest;
DELIMITER /
CREATE OR REPLACE PROCEDURE actortest(OUT n_actor_id INT)
BEGIN

    DECLARE EXIT HANDLER FOR SQLEXCEPTION
    BEGIN
         GET DIAGNOSTICS CONDITION 1 @SQLSTATE = RETURNED_SQLSTATE,
     @errno = MYSQL_ERRNO, @TEXT = MESSAGE_TEXT;
     SET @full_error = CONCAT("ERROR ", @errno, " (", @SQLSTATE, "):", @TEXT);
     SELECT @full_error;
    END;

    SELECT actor_id INTO n_actor_id FROM NOT_actor_ctor WHERE actor_id = 1;
     -- SET n_actor_id = 55;

END; /

DELIMITER ;
```

### Variante 2: Mit Schreiben in log-tabelle

```
USE `sakila`;
CREATE TABLE IF NOT EXISTS applogs (id INT AUTO_INCREMENT, message MEDIUMTEXT, PRIMARY
KEY(id));

DROP PROCEDURE IF EXISTS actortest;
DELIMITER /
CREATE OR REPLACE PROCEDURE actortest(OUT n_actor_id INT)
BEGIN

    DECLARE EXIT HANDLER FOR SQLEXCEPTION
    BEGIN
    GET DIAGNOSTICS CONDITION 1 @SQLSTATE = RETURNED_SQLSTATE,
     @errno = MYSQL_ERRNO, @TEXT = MESSAGE_TEXT;
     SET @full_error = CONCAT("ERROR ", @errno, " (", @SQLSTATE, "):", @TEXT);
     INSERT INTO applogs (message) VALUES (@full_error);
     SELECT @full_error;
     END;

    SELECT actor_id INTO n_actor_id FROM NOT_actor_ctor WHERE actor_id = 1;
     -- SET n_actor_id = 55;
```

```
END; /

DELIMITER ;
```

# ERRORS

### Error Codes List

- https://mariadb.com/kb/en/mariadb-error-codes/

# LOCKS

### Table wide locks

### InnoDB Implicit Locks

### How do the work in general

- Implicit locks are done by InnoDB itself
- We can only partly influence them.

### Who wants what ?

```
<who?, what?, how?, granted?>
```

### Explanation (a bit clumsy)

- IS and IX (intended share an intended write lock)
- IS and IX can be trigged on SQL
- IX -> SUFFIX -> FOR UPDATE (this triggers a IX lock)
- IX and IS are the first step (on table layer)
- After that IX -> tries to get an write lock on row-level -> X
- Works unless there is another X
- IX and IS is not retrieved on TABLE spaced operations (construction --- alter)

### Lock Type compability matrix

```
    X           IX          S           IS
X   Conflict    Conflict    Conflict    Conflict
IX  Conflict    Compatible  Conflict    Compatible
S   Conflict    Conflict    Compatible  Compatible
IS  Conflict    Compatible  Compatible  Compatible
```

### The best explanation across the internet ;o)

- http://stackoverflow.com/questions/25903764/why-is-an-ix-lock-compatible-with-another-ix-lock-in-innodb|IX_and_IS-locks

```
Many people, both visitors and curators, enter the museum.
The visitors want to view paintings, so they wear a badge labeled "IS".
The curators may replace paintings, so they wear a badge labeled "IX".
There can be many people in the museum at the same time, with both types of badges.
They don't block each other.

During their visit, the serious art fans will get as close to the painting as they
can,
and study it for lengthy periods.
```

They're happy to let other art fans stand next to them before the same painting.
They therefore are doing SELECT ... LOCK IN SHARE MODE and they have "S" lock,
because they at least don't want the painting to be replaced while they're studying
it.

The curators can replace a painting, but they are courteous to the serious art fans,
and they'll wait until these viewers are done and move on.
So they are trying to do SELECT ... FOR UPDATE (or else simply UPDATE or DELETE).
They will acquire "X" locks at this time, by hanging a little sign up saying "exhibit
being redesigned."
The serious art fans want to see the art presented in a proper manner, with nice
lighting and some descriptive placque.
They'll wait for the redesign to be done before they approach (they get a lock wait if
they try).

### SELECT FOR UPDATE

#### Important

- It only locks (X) the rows needed, not the complete table

#### When is it used ?

- You want to be sure, a specific dataset will not be changed

#### Example

```
create database if not exists training;
use training;
create table rooms (room_id tinyint auto_increment, room varchar(20), primary
key(room_id));
create table bookings (booking_id int auto_increment, room_id tinyint, name
varchar(20), primary key(booking_id));
insert into rooms (room) values ('Honeymoon');
insert into rooms (room) values ('Sunset');

## Session 1:
BEGIN;
select room_id from rooms where room_id = 1 for update;

## Session 2:
BEGIN
use training;
delete from rooms where room_id = 2;
delete from rooms where room_id = 1;
-- transaction waiting

## Session 3:
SELECT   waiting_trx_id,   waiting_pid,   waiting_query,   blocking_trx_id,
blocking_pid,   blocking_query FROM sys.innodb_lock_waits;

## Session 1:
COMMIT;

## Session 2:
## See what happens
```

## sys (Database included since MariaDB 10.6 AFAIK)

### show innodb locks with sys

```
SELECT waiting_trx_id, waiting_pid, waiting_query, blocking_trx_id, blocking_pid,
blocking_query
FROM sys.innodb_lock_waits;
```

## Formatierung Ausgaben / Funktionen

### Datumsausgabe formatieren

- https://mariadb.com/kb/en/date_format/

### Strings zusammenfügen

- https://mariadb.com/kb/en/concat/

## Partitions

### Maintain Partitions and Explain

### Walkthrough

```
##
## EXPLAIN PARTITIONS
##
DROP TABLE IF EXISTS audit_log;
CREATE TABLE audit_log (
  yr    YEAR NOT NULL,
  msg   VARCHAR(100) NOT NULL)
ENGINE=InnoDB
PARTITION BY RANGE (yr) (
  PARTITION p0 VALUES LESS THAN (2010),
  PARTITION p1 VALUES LESS THAN (2011),
  PARTITION p2 VALUES LESS THAN (2012),
  PARTITION p3 VALUES LESS THAN MAXVALUE);
INSERT INTO audit_log(yr,msg) VALUES (2005,'2005'),(2006,'2006'),(2011,'2011'),
(2020,'2020');
EXPLAIN PARTITIONS SELECT * from audit_log WHERE yr in (2011,2012)\G
```

### Example with years

```
CREATE TABLE audit_log2 (   yr    YEAR NOT NULL,   msg   VARCHAR(100) NOT NULL)
ENGINE=InnoDB PARTITION BY RANGE (yr) (   PARTITION p2009 VALUES LESS THAN (2010),
PARTITION p2010 VALUES LESS THAN (2011),   PARTITION p2011 VALUES LESS THAN (2012),
PARTITION p_current VALUES LESS THAN MAXVALUE);
INSERT INTO audit_log2(yr,msg) VALUES (2005,'2005'),(2006,'2006'),(2011,'2011'),
(2012,'2012');

EXPLAIN PARTITIONS SELECT * from audit_log2 WHERE yr = 2012;

ALTER TABLE audit_log2 REORGANIZE PARTITION p_current INTO (
   PARTITION p2012 VALUES LESS THAN (2013),
   PARTITION p_current VALUES LESS THAN MAXVALUE);
)

--  Where is data now saved
EXPLAIN PARTITIONS SELECT * from audit_log2 WHERE yr = 2012;
```

### Eine bestehende große Tabelle partitionieren (mariadb)

```
Variante 1:
## Wichtig vorher Daten sichern

ALTER TABLE `audit_log3` PARTITION BY RANGE (`yr`) ( PARTITION p2009 VALUES LESS THAN
(2010) ENGINE=InnoDB, PARTITION p2010 VALUES LESS THAN (2011) ENGINE=InnoDB, PARTITION
p2011 VALUES LESS THAN (2012) ENGINE=InnoDB, PARTITION p2012 VALUES LESS THAN (2013)
ENGINE=InnoDB, PARTITION p_current VALUES LESS THAN MAXVALUE ENGINE=InnoDB )

Variante 2:
Daten ausspielen ohne create (dump)  + evtl zur sicherheit Struktur-Dump
Tabelle löschen
Daten ohne Struktur einspielen
```

### Partitionierung entfernen

```
ALTER TABLE audit_log  REMOVE PARTITIONING;
```

### Ref:

- https://mariadb.com/kb/en/partition-maintenance/

## Performance

### * vs. specific field in field list - select

```
## You need to set up contributions database to test that
use contributions

## Variant 1: ALL Fields

mysql> select * from contributions limit 0,100000
100000 rows in set (0.25 sec)

## Variant 2: Specific field
## Try this multiple times, because the first time it is not
## in the innodb buffer (cache)

mysql> select vendor_last_name from contributions limit 0,100000;
100000 rows in set (0.04 sec)

## Result: Variant 2 wins over Variant 1
## The difference between these 2 is factor 5x in my case
```

### Möglichst keine Funktion in where (spalte) verwenden

```
## Bad for performance

## Bad

## Good
```

### SQL-Rewrite Pager- Subselect

```
explain SELECT film_id, description FROM sakila.film ORDER BY title LIMIT 50, 5;
+----+-------------+-------+------------+------+---------------+------+---------+-----
-+------+----------+----------------+
| id | select_type | table | partitions | type | possible_keys | key  | key_len | ref
| rows | filtered | Extra          |
+----+-------------+-------+------------+------+---------------+------+---------+-----
-+------+----------+----------------+
|  1 | SIMPLE      | film  | NULL       | ALL  | NULL          | NULL | NULL    | NULL
| 1000 |   100.00 | Using filesort |
+----+-------------+-------+------------+------+---------------+------+---------+-----
-+------+----------+----------------+
1 row in set, 1 warning (0.00 sec)

## Achtung auf title ist ein index sonst geht es nicht
SELECT film.film_id, film.description
FROM sakila.film

```

## Analyzing Slow Queries / Indexes

### Create unique index

```
CREATE UNIQUE INDEX HomePhone ON Employees(Home_Phone);
```

### Find indexes

### Show index from table

```
create database showindex;
use showindex;
CREATE TABLE `people` (
  `id` int(10) unsigned NOT NULL AUTO_INCREMENT,
  `first_name` varchar(25) DEFAULT NULL,
  `last_name` varchar(25) DEFAULT NULL,
  `passcode` mediumint(8) unsigned DEFAULT NULL,
  PRIMARY KEY (`id`),
  UNIQUE KEY `idx_passcode` (`passcode`),
  KEY `idx_first_name_last_name` (`first_name`,`last_name`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1
show index from people
```

#### Show create table

```
show create table peple
```

#### show index from

```
show index from contributions
```

### Create Index/Delete/Drop Index

```
create index idx_vendor_state on contributions (vendor_state);
```

## Drop/Delete Index

```
drop index idx_last_name_first_name on customer;
```

### Indizes

### Avoid ALL

- is the worst type : TABLE SCAN (Need to go through all rows)

```
mysql> create table actor4 as select * from actor;
mysql> explain select * from actor4 where actor_id > 10;
+----+-------------+--------+------------+------+---------------+------+---------+----
--+------+----------+-------------+
| id | select_type | table  | partitions | type | possible_keys | key  | key_len | ref
| rows | filtered | Extra       |
+----+-------------+--------+------------+------+---------------+------+---------+----
--+------+----------+-------------+
|  1 | SIMPLE      | actor4 | NULL       | ALL  | NULL          | NULL | NULL    |
NULL |  200 |    33.33 | Using where |
+----+-------------+--------+------------+------+---------------+------+---------+----
--+------+----------+-------------+
1 row in set, 1 warning (0.00 sec)
```

## Cover Index.

- We can get all the necessary information from the index (no acces of filesystem necessary)

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_last_name on actor2 (last_name);

## using index
## <- indicates that a cover index is used

mysql> explain select last_name from actor2 where last_name like 'B%';
+----+-------------+--------+------------+-------+-----------------------+-------------
---------+---------+------+------+----------+--------------------------+
| id | select_type | table  | partitions | type  | possible_keys         | key
| key_len | ref  | rows | filtered | Extra                    |
+----+-------------+--------+------------+-------+-----------------------+-------------
---------+---------+------+------+----------+--------------------------+
|  1 | SIMPLE      | actor2 | NULL       | range | idx_actor2_last_name |
idx_actor2_last_name | 182     | NULL |   22 |   100.00 | Using where; Using index |
+----+-------------+--------+------------+-------+-----------------------+-------------
---------+---------+------+------+----------+--------------------------+
1 row in set, 1 warning (0.00 sec)
```

## Creating a primary index

```
create index primary key on actor2 (actor_id)
explain select actor_id from actor2 where actor_id > 2
```

## Using an index for last_name

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_last_name on actor2 (last_name);
explain select * from actor2 where last_name like 'B%';
+----+-------------+--------+------------+-------+-----------------------+-------------
---------+---------+------+------+----------+-----------------------+
| id | select_type | table  | partitions | type  | possible_keys         | key
| key_len | ref  | rows | filtered | Extra                 |
+----+-------------+--------+------------+-------+-----------------------+-------------
---------+---------+------+------+----------+-----------------------+
|  1 | SIMPLE      | actor2 | NULL       | range | idx_actor2_last_name |
idx_actor2_last_name | 182     | NULL |   22 |   100.00 | Using index condition |
+----+-------------+--------+------------+-------+-----------------------+-------------
---------+---------+------+------+----------+-----------------------+
1 row in set, 1 warning (0.00 sec)
```

## Never use a function in where

### Why ?

```
Step 1: MySQL needs to retrieve every row
Step 2: run function
--> so, no index can be used
```

### Example

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_last_name on actor2 (last_name);
explain select * from actor2 where last_name like
concat(substring(first_name,1,1),'%');
```

## Index is always read from left to right

```
## so the index cannot be used if we ask for last_name
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_first_name_last_name on actor2 (first_name,last_name);
explain select * from actor2 where last_name like 'B%';
##
explain select * from actor2 where first_name like 'B%';
```

### Explain

### Einfacher Fall

```
explain select * from actor
```

### Erweiterter Fall

```
explain extended select * from user
show warnings
```

### Anzeigen der Partitions

```
explain partitions select * from actor
```

### Ausgabe im JSON-Format

```
## Hier gibt es noch zusätzliche Informationen
explain format=json select * from actor
```

```
explain format=json  SELECT a.first_name, a.last_name, fa.film_id FROM film_actor2 fa
INNER JOIN actor2 a ON fa.actor_id = a.actor_id
```

## What does type say ?

- https://mariadb.com/kb/en/explain/

### profiling-get-time-for-execution-of.query

- Get better values, how long queries take

### Example

```
set profiling = 1
-- Step 2 - Execute query
select last_name as gross from donors where last_name like lower('WILLI%')

## Step 3 - Show profiles
show profiles;
+----------+------------+-------------------------------------------------------------------
----------------------+
| Query_ID | Duration   | Query
|
+----------+------------+-------------------------------------------------------------------
----------------------+
|        1 | 0.01993525 | select last_name as gross from donors where last_name like
lower('WILLI%')        |
4 rows in set, 1 warning (0.00 sec)

## Step 4 - Show profile for a specific query
mysql> show profile for query 1;
+----------------------+----------+
| Status               | Duration |
+----------------------+----------+
| starting             | 0.000062 |
| checking permissions | 0.000006 |
| Opening tables       | 0.000021 |
| init                 | 0.000017 |
| System lock          | 0.000007 |
| optimizing           | 0.000007 |
| statistics           | 0.000083 |
| preparing            | 0.000012 |
| executing            | 0.000004 |
| Sending data         | 0.022251 |
| end                  | 0.000005 |
| query end            | 0.000008 |
| closing tables       | 0.000007 |
| freeing items        | 0.001792 |
| cleaning up          | 0.000016 |
+----------------------+----------+
15 rows in set, 1 warning (0.00 sec)
```

### Kein function in where verwenden

### 1. No function in where (column_name)

```
## Never use a function for the column name in where
## e.g.
select * from donors where upper(last_name) like 'Willia%'
```

**Why ?**

- Not index can be used

```
## Not filtering possible by indx -> possible_keys -> NULL
 explain select last_name from donors where upper(last_name) like 'WILLI%';
+----+-------------+--------+------------+-------+---------------+-------------------
+---------+------+--------+----------+--------------------------+
| id | select_type | table  | partitions | type  | possible_keys | key               |
key_len | ref  | rows   | filtered | Extra                    |
+----+-------------+--------+------------+-------+---------------+-------------------
+---------+------+--------+----------+--------------------------+
|  1 | SIMPLE      | donors | NULL       | index | NULL          | donors_donor_info |
687     | NULL | 701948 |   100.00 | Using where; Using index |
+----+-------------+--------+------------+-------+---------------+-------------------
+---------+------+--------+----------+--------------------------+
1 row in set, 1 warning (0.00 sec)
```

### Optimizer-hints (and why you should not use them)

### Tell the optimizer what to do and what not to do

- https://dev.mysql.com/doc/refman/5.7/en/optimizer-hints.html#optimizer-hints-syntax

### This one is good for debugging / do not use index at all

```
explain select vendor_city from contributions use index() where vendor_city like 'S%'
```

### Query-Plans aka Explains

- Query Plans are the same as Query Execution Plans (QEP's)
- You will see the Query Plan's with explain

### Example

```
mysql> explain select * from recipients where recipient_id > 1 and recipient_id < 5;
+----+-------------+------------+------------+-------+---------------+---------+------
---+------+------+----------+-------------+
| id | select_type | table      | partitions | type  | possible_keys | key     |
key_len | ref  | rows | filtered | Extra       |
+----+-------------+------------+------------+-------+---------------+---------+------
---+------+------+----------+-------------+
|  1 | SIMPLE      | recipients | NULL       | range | PRIMARY       | PRIMARY | 4
| NULL |    1 |   100.00 | Using where |
+----+-------------+------------+------------+-------+---------------+---------+------
---+------+------+----------+-------------+
1 row in set, 1 warning (0.01 sec)
```

### Output-Format json

```
-- includes costs
EXPLAIN format=json SELECT * from audit_log WHERE yr in (2011,2012);
```

### Select_Type

- simple = one table

### Types (in order of performance

#### system

```
Only one row in table is present (only one insert)
```

### Query Pläne und die Key-Länge

### Example

```
 select table_schema,table_name,character_set_name,column_name from
information_schema.columns where table_name = 'donors'
and column_name = 'city';
+---------------+------------+--------------------+-------------+
| table_schema  | table_name | character_set_name | column_name |
+---------------+------------+--------------------+-------------+
| contributions | donors     | utf8               | city        |
+---------------+------------+--------------------+-------------+
1 row in set (0.00 sec)
```

```
mysql> describe donors;
+--------------------+-------------+------+-----+---------+----------------+
| Field              | Type        | Null | Key | Default | Extra          |
+--------------------+-------------+------+-----+---------+----------------+
| donor_id           | int(11)     | NO   | PRI | NULL    | auto_increment |
| last_name          | varchar(70) | YES  | MUL | NULL    |                |
| first_name         | varchar(35) | YES  |     | NULL    |                |
| address_1          | varchar(35) | YES  |     | NULL    |                |
| address_2          | varchar(36) | YES  |     | NULL    |                |
| city               | varchar(20) | YES  | MUL | NULL    |                |
| state              | varchar(15) | YES  |     | NULL    |                |
| zip                | varchar(11) | YES  |     | NULL    |                |
| employer           | varchar(70) | YES  |     | NULL    |                |
| occupation         | varchar(40) | YES  |     | NULL    |                |
| last_name_reversed | varchar(70) | YES  | MUL | NULL    |                |
+--------------------+-------------+------+-----+---------+----------------+
11 rows in set (0.00 sec)
```

```
## only the first part of the combined index is used, because 213 bytes is a
varchar(70) for utf8 - characters in index
## utf8 takes up to 3 bytes per character.
mysql> explain select first_name,last_name from donors where last_name like 'Wi%';
+----+-------------+--------+------------+-------+-------------------+----------------
---+---------+------+-------+----------+-------------------------+
| id | select_type | table  | partitions | type  | possible_keys     | key
| key_len | ref  | rows  | filtered | Extra                   |
+----+-------------+--------+------------+-------+-------------------+----------------
---+---------+------+-------+----------+-------------------------+
|  1 | SIMPLE      | donors | NULL       | range | donors_donor_info |

mysql>
```

### Index und Likes

### 1. like 'Will%' - Index works

explain select last_name from donors where last_name like 'Will%';

### 2. like '%iams' - Index does not work

```
-- because like starts with a wildcard
explain select last_name from donors where last_name like '%iams';
```

### 3. How to fix 3, if you are using this often ?

```
## Walkthrough
## Step 1: modify table
alter table donors add last_name_reversed varchar(70) GENERATED ALWAYS AS
(reverse(last_name));
create index idx_last_name_reversed on donors (last_name_reversed);

## besser - Variante 2 - untested
alter table donors add last_name_reversed varchar(70) GENERATED ALWAYS AS
(reverse(last_name)), add index idx_last_name_reversed on donors (last_name_reversed);

## Step 2: update table - this take a while
update donors set last_name_reversed = reversed(last_name)
## Step 3: work with it
select last_name,last_name_reversed from donor where last_name_reversed like
reverse('%iams');
```

```
## Version 2 with pt-online-schema-change
```

## Index und Joins

## Take a look which order the optimizer uses

### With date

```
-- Using a date which has no index
-- Needs to do a table scan
explain select c.* from contributions c join donors d using (donor_id) join recipients
r using (recipient_id) where c.date_recieved > '1999-12-01' and c.date_recieved <
'2000-07-01';
+----+-------------+-------+------------+--------+-------------------------+---------
+---------+-------------------------------+---------+----------+-------------+
| id | select_type | table | partitions | type   | possible_keys           | key     |
key_len | ref                           | rows    | filtered | Extra       |
+----+-------------+-------+------------+--------+-------------------------+---------
+---------+-------------------------------+---------+----------+-------------+
|  1 | SIMPLE      | c     | NULL       | ALL    | donor_idx,recipient_idx | NULL    |
NULL    | NULL                          | 2028240 |    11.11 | Using where |
|  1 | SIMPLE      | r     | NULL       | eq_ref | PRIMARY                 | PRIMARY |
4       | contributions.c.recipient_id |       1 |   100.00 | Using index |
|  1 | SIMPLE      | d     | NULL       | eq_ref | PRIMARY                 | PRIMARY |
4       | contributions.c.donor_id     |       1 |   100.00 | Using index |
+----+-------------+-------+------------+--------+-------------------------+---------
+---------+-------------------------------+---------+----------+-------------+
3 rows in set, 1 warning (0.00 sec)

60626 rows in set (7.22 sec)
```

### With date and filter on donor

```
 explain select c.*,d.last_name from contributions c join donors d using (donor_id)
join recipients r using (recipient_id)
where c.date_recieved > '1999-12-01' and c.date_recieved < '2000-07-01' and
d.last_name like 'A%';
+----+-------------+-------+------------+--------+-------------------------+--------
-----------+---------+-------------------------------+-------+----------+-------------
------------+
| id | select_type | table | partitions | type   | possible_keys           | key
| key_len | ref                           | rows  | filtered | Extra
|
+----+-------------+-------+------------+--------+-------------------------+--------

### Find out cardinality without index

### Find out cardinality without creating index

```
select count(distinct donor_id) from contributions;
```

```
select count(distinct(vendor_city)) from contributions;
+------------------------------+
| count(distinct(vendor_city)) |
+------------------------------+
|                         1772 |
+------------------------------+
1 row in set (4.97 sec)
```

### Index and Functions

### No index can be used on an index:

```
explain select * from actor where upper(last_name) like 'A%';
+----+-------------+-------+------------+------+---------------+------+---------+-----
-+------+----------+-------------+
| id | select_type | table | partitions | type | possible_keys | key  | key_len | ref
| rows | filtered | Extra       |
+----+-------------+-------+------------+------+---------------+------+---------+-----
-+------+----------+-------------+
|  1 | SIMPLE      | actor | NULL       | ALL  | NULL          | NULL | NULL    | NULL
|  200 |   100.00 | Using where |
+----+-------------+-------+------------+------+---------------+------+---------+-----
-+------+----------+-------------+
```

### Workaround with virtual columns (possible since mysql 5.7)

```
## 1. Create Virtual Column with upper
alter table sakila add idx_last_name_upper varchar(45) GENERATED ALWAYS AS
upper(last_name);
## 2. Create an index on that column
create index idx_last_name_upper on actor (last_name_upper);
```

### Workaround with persistent/virtual columns (MariaDB)

```
mysql> alter table actor add column last_name_upper varchar(45) as (upper(last_name))
PERSISTENT ;
mysql> insert into actor (first_name,last_name,last_name_upper) values
('Max','Mustermann','MUSTERMANN');
mysql> select * from actor order by actor_id desc limit 1;
mysql> -- setting index
mysql> create index idx_last_name_upper on actor (last_name_upper);
Query OK, 0 rows affected (0.007 sec)
Records: 0  Duplicates: 0  Warnings: 0
mysql> -- to use index we need to avoid the function in where
mysql> explain select * from actor where last_name_upper like 'WI%' \G
```

### Index neu aufbauen ?

```
## Aus meiner Sicht sollte das auch so für die aktuelle MariaDB Version 10.6 gelten

For basic cleanup and re-analyzing you can run "OPTIMIZE TABLE ...", it will compact
out the overhead in the indexes and run ANALYZE TABLE too, but it's not going to re-
sort them and make them as small & efficient as they could be.

https://dev.mysql.com/doc/refman/8.0/en/optimize-table.html

However, if you want the indexes completely rebuilt for best performance, you can:

drop / re-add indexes (obviously)
dump / reload the table
ALTER TABLE and "change" using the same storage engine
REPAIR TABLE (only works for MyISAM, ARCHIVE, and CSV)
https://dev.mysql.com/doc/refman/8.0/en/rebuilding-tables.html

If you do an ALTER TABLE on a field (that is part of an index) and change its type,
then it will also fully rebuild the related index(es).
```

### Index Stats

### General

```
Index stats where introduced in MariaDB 10.4
(These can be used by the query optimizer)

Before that only indexes were used,
now it is also possible these stats into account

The stats are saved in the mysql-database
mysql.column_stats
mysql.table_stats
mysql.index_stats

These are histogramm stats,
they are used automatically from 10.4.1 on,
but they are not created automatically.

You have to perform an operation which is
cost intensive to create them, because a full
table scan is done.

These stats are
Engine-independent Statistics
```

### Notes

- Stats are currently used (MariaDB 10.6) by default because of setting
  - show variables like 'use_stat_tables'
  - -> preferably_for_queries
- But: They are not created automatically (see Howto how to do that)
- Also: They are not deleted automatically

### Howto

```
use mysql;
select * from column_stats;
select * from index_stats;
select * from table_stats;
use contributions;
ANALYZE TABLE contributions PERSISTENT FOR ALL;

use mysqL;
select * from column_stats;
select * from index_stats;
select * from table_stats;
```

### When will it be used ?

```
2021-08-11: Looks like it is currently used for range-scan for the optimizer,
which table to start with

An excessive example can be found here:
```

# Tools

### Percona Toolkit

### Walkthrough (Ubuntu 20.04)

```
## Howto
## https://www.percona.com/doc/percona-toolkit/LATEST/installation.html

## Step 1: repo installieren mit deb -paket
wget https://repo.percona.com/apt/percona-release_latest.focal_all.deb
apt update
apt install -y curl
dpkg -i percona-release_latest.focal_all.deb
apt update
apt install -y percona-toolkit
```

### Walkthrough (Debian 10)

```
sudo apt update
sudo apt install -y wget gnupg2 lsb-release curl
cd /usr/src
wget https://repo.percona.com/apt/percona-release_latest.generic_all.deb
dpkg -i percona-release_latest.generic_all.deb
apt update
apt install -y percona-toolkit
```

```
sudo apt update; sudo apt install -y wget gnupg2 lsb-release curl; cd /usr/src; wget
https://repo.percona.com/apt/percona-release_latest.generic_all.deb; dpkg -i percona-
release_latest.generic_all.deb; apt update; apt install -y percona-toolkit
```

### pt-query-digest - analyze slow logs

### Requires

- Install percona-toolkit

### Usage

```
## first enable slow_query_log
set global slow_query_log = on
set global long_query_time = 0.2
## to avoid, that i have to reconnect with new session
set session long_query_time = 0.2

## produce slow query - for testing
select * from contributions where vendor_last_name like 'W%';
mysql > quit

##
cd /var/lib/mysql
## look for awhile wih -slow.log - suffix
pt-query-digest mysql-slow.log > /usr/src/report-slow.txt
less report-slow.txt
```

### pt-online-schema-change howto

### Requirements

- Install percona-toolkit

### Documentation

- https://www.percona.com/doc/percona-toolkit/3.0/pt-online-schema-change.html

### What does it do ?

```
## Altering table without blocking them
## Do a dry-run beforehand
pt-online-schema-change --alter "ADD INDEX idx_city (city)" --dry-run
D=contributions,t=donors
##
pt-online-schema-change --alter "ADD INDEX idx_city (city)" --execute
D=contributions,t=donors
```

### With foreign - keys

```
 # first try
 pt-online-schema-change --alter "add column remark varchar(150)" D=sakila,t=actor --
alter-foreign-keys-method=auto --dry-run
 # then run
 pt-online-schema-change --alter "add column remark varchar(150)" D=sakila,t=actor --
alter-foreign-keys-method=auto --execute
```

### Example sys-schema and Reference

```
mysql> select * from sys.host_summary\G
*************************** 1. row ***************************
                   host: localhost
             statements: 1347
     statement_latency: 7.55 m
 statement_avg_latency: 336.50 ms
           table_scans: 15
              file_ios: 612857
       file_io_latency: 1.66 m
   current_connections: 1
     total_connections: 7
          unique_users: 1
        current_memory: 0 bytes
total_memory_allocated: 0 bytes
1 row in set (0.01 sec)
```

### Ref:

- https://github.com/mysql/mysql-sys/blob/master/README.md

### Profiling

### Example

```
MariaDB [(none)]> SET profiling = 1;
Query OK, 0 rows affected (0.000 sec)

MariaDB [(none)]> select * from actor where last_name like 'D%';
ERROR 1046 (3D000): No database selected
MariaDB [(none)]> use sakila;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Database changed
MariaDB [sakila]> select * from actor where last_name like 'D%';

MariaDB [sakila]>
```

# Backup und Restore

### Backup und Restore

### Unter Linux

```
mysqldump sakila > /usr/src/sakila.sql
mysql sakila < /usr/src/sakila.sql
echo "show tables;" | mysql sakila;

##echo "create schema verleih;" | mysql
## oder
mysql -e 'create schema verleih'
mysql verleih < /usr/src/sakila.sql
```

# Unter Windows

```
## mysqldump muss entweder in der %PATH% variablen stehen oder wir müssen
## bin verzeichnis von mysql, sein,
## vorher cmd.exe ausführen über Windows ausführen (oder Suchfeld cmd)
mysqldump -uext -p -h 127.0.0.1 sakila  > C:\Users\Jochen Metzger\Documents\sakila.sql
```

### Nur Struktur sichern

```
mysqldump --no-data --all-databases --events --routines > all-structure.sql
```

### Nur daten pro Tabelle

```
mysqldump --no-create-info sakila actor > sakila-actor-data.sql
```

## Tipps & Tricks

### Dummy table DUAL

- https://mariadb.com/kb/en/dual/

### Wie kann ich verwendete Storage Engine rausfinden - Table

```
use sakila;
show create table actor;
```

### SHOW VARIABLES WITH WHERE

```
SHOW VARIABLES WHERE VARIABLE_NAME like '%slow%' OR VARIABLE_NAME LIKE '%long%'
```

### Schnellster Import von Daten mit csv

### Example

```
LOAD DATA INFILE '/tmp/test.txt' INTO TABLE test
  FIELDS TERMINATED BY ','  LINES STARTING BY 'xxx';

LOAD DATA INFILE 'data.txt' INTO TABLE tbl_name
  FIELDS TERMINATED BY ',' ENCLOSED BY '"'
  LINES TERMINATED BY '\r\n'
  IGNORE 1 LINES;
```

### General/Ref

- Is the quickest way
- Performance Ref: https://jynus.com/dbahire/testing-the-fastest-way-to-import-a-table-into-mysql-and-some-interesting-5-7-performance-results/

### Queries in Datenbank (mysql) loggen, die keine Indizes verwenden

```
-- long_query_time can auf 10 sec bleiben
SET GLOBAL log_queries_not_using_indexes = 1;
SET GLOBAL log_output = 'TABLE';
-- last setting
SET slow_query_log = 1;
```

### Workaround Materialized View

```
CREATE EVENT `tr_sakila_aggregate`
    ON SCHEDULE
        EVERY 1 MONTH STARTS '2021-08-12 11:20:00'
    ON COMPLETION PRESERVE
    ENABLE
    COMMENT 'Simulation Materialized View (Light)'
    DO BEGIN
   DROP TABLE IF EXISTS sakila_aggregate;
   CREATE TABLE sakila_aggregate AS SELECT actor_id,last_name,first_name FROM actor
WHERE actor_id > 200;
END
```

### Zeichensatz umstellen

### Example (if it works it is great)

```
-- Do this for every table
ALTER TABLE Tabellenname CONVERT TO CHARACTER SET utf8 COLLATE utf8_general_ci
ALTER DATABASE Datenbankname DEFAULT CHARACTER SET  utf8 COLLATE utf8_general_ci
```

### Settings des und des Clients herausfinden

```
## im mysql
mysql>status;

## mit sql z.B. heidisql
show variables like '%char%';
```

### Ref. with problems (specific project)

- https://fromdual.com/mariadb-and-mysql-character-set-conversion

### Hat InnoDB genug Speicher - Pages

### Variante 1

```
SHOW STATUS LIKE '%pages_free%';
```

### Variante 2:

```
MariaDB [sakila]> pager grep "Free buffer";
PAGER set to 'grep "Free buffer"'
MariaDB [sakila]> show engine innodb status;
Free buffers       0
1 row in set (0.001 sec)
```

## Storage Engines

### MyISAM Key Buffer

- http://www.mysqlab.net/knowledge/kb/detail/topic/myisam/id/7200

## Oracle

### Activating Oracle Sql-Mode

```
## ACTIVATE GLOBALLY (for complete server) - not persistent
## if you want to activate it globally
## this will not be available in the current session though
mysql>SET GLOBAL sql_mode='ORACLE'
mysql> SELECT @@GLOBAL.sql_mode -- available globally
mysql> SELECT @@sql_mode -- in session. not present yet.

## FOR THE session to be active, either reconnect or set it explicitly
mysql>SET sql_mode='ORACLE'
mysql>SELECT @@sql_mode
```

### Overview Oracle Mode

- https://mariadb.com/kb/en/sql_modeoracle/

### When Others-Clause

- https://www.techonthenet.com/oracle/exceptions/when_others.php

## Working with database objects

### Working with databases

### Explanations

```
## open a connection to the mysql-server by entering
mysql
## then you will get
mysql>
```

```
## Comments within mysql-client
## three - in a row
---
```

### Create database

```
create database training
create schema training2
```

### Show databases

```
mysql
mysql>
;; from here i leave out mysql>
;; so you can easily copy & paste the lines hereafter
show databases

--
-- or
--

show schemas

--
```

```
-- or by using information_schema
--

select * from information_schema.schemata;
```

## Working with tables

### Show tables

```
## within mysql>
## so on the command-line enter:
## mysql (as root)
USE sakila
SHOW TABLES

-- or --

select * from information_schema.TABLES
```

#### Create table

```
-- only if you want to create table in a completely new database
create schema training;
USE training
CREATE TABLE people (id INT NOT NULL AUTO_INCREMENT, name VARCHAR(20), PRIMARY
KEY(id));
```

#### Find out the structure of the table

```
## you have to connect to db first with
## mysql
## within mysql>
DESCRIBE people
SHOW CREATE TABLE people
-- or : if you want to know more --
SELECT * from INFORMATION_SCHEMA.COLUMNS WHERE TABLE_NAME='people' AND
TABLE_SCHEMA='training' \G
```

#### Show indexes

```
SHOW INDEX FROM actor
SHOW INDEXES FROM ACTOR
```

#### Change table (Add field)

```
--- We want to add a field before name
--- IMPORTANT: BEFORE does not exist
ALTER TABLE people ADD first_name VARCHAR(10) AFTER id;

ALTER TABLE schulungen ADD seats TINYINT unsigned DEFAULT 1, ADD price DECIMAL(6,2);
ALTER TABLE schulungen ADD (room TINYINT unsigned DEFAULT 1,  discount DECIMAL(6,2));
```

#### Modify a field in table (Change property)

```
ALTER TABLE people
    MODIFY COLUMN first_name VARCHAR(20);
```

**Drop a field from the table**

```
ALTER TABLE people ADD middle_name VARCHAR(25) BEFORE name;
DESCRIBE people;
ALTER TABLE people DROP COLUMN middle_name;
```

```
## More Examples
--
ALTER TABLE actor ADD in_rente BOOLEAN default true
INSERT INTO actor (first_name,last_name,in_rente) values ('Jochen','Metzger',false)
-- Wieder loswerden
ALTER TABLE actor DROP in_rente;
## add and drop in once command
ALTER TABLE actor ADD in_rente2 BOOLEAN default true, DROP in_rente;
```

**Deleting table data (truncate)**

```
USE sakila
-- Create table based on other table
CREATE TABLE actorcopy as SELECT * FROM actor;
-- Fields ?
SELECT * FROM actorcopy;
-- Empty it
TRUNCATE TABLE actorcopy;
-- Emptry ?
SELECT COUNT(*) FROM actorcopy;
```

**Delete table data (with delete)**

**Explanation**

- Do not use delete when you want to use data of complete table
  - truncate is quicker in this case.
- DELETE FROM ... WHERE ... does a SELECT first

**Example**

```
USE sakila
CREATE TABLE actorbackup AS SELECT * FROM actor;
SELECT COUNT(*) FROM actorbackup;
DELETE FROM actorbackup WHERE actor_id > 100;
SELECT COUNT(*) FROM actorbackup;
```

**Delete complete table**

```
USE sakila
DROP TABLE actorbackup;
```

### Teststellung - Feld verkleinern

```
ALTER TABLE actor ADD filme tinyint unsigned default 255;
-- Does not work
-- UPDATE actor SET filme = 256  WHERE actor_id = 1;
-- ALTER TABLE actor MODIFY filme smallint unsigned default 256;
INSERT INTO actor (first_name,last_name) values ('Gaucho','Poncho');
INSERT INTO actor (first_name,last_name,filme) values ('Gauchina','Ponchina',32000);

-- Does not work
ALTER TABLE actor MODIFY filme tinyint unsigned;
```

# SELECT

### Select Beispiele

### Einfaches Beispiel (bestimmte Felder)

```
## Zeige alle diese felder aus dieser Tabelle
SELECT <welche_feld_mit_komma_getrennt> FROM <welche tabelle>

-- bitte datenbank sakila verwenden
use sakila
-- zeige actor_id, last_name
SELECT actor_id, last_name FROM actor
```

### Einfaches Beispiel (alle Felder)

```

-- bitte datenbank sakila verwenden
use sakila
-- zeige actor_id, last_name
SELECT * FROM actor
```

### Einfaches Beispiel mit Bedingung

```
-- SYNTAX
use sakila;
-- SELECT <welche_felder> FROM <welche_tabelle> WHERE
<wo_welches_feld_welchen_wert_hat>
-- Beispiel 1
SELECT actor_id, last_name FROM actor where actor_id = 5;
-- Beispiel 2
SELECT * FROM actor where actor_id = 5;
```

### Einfache Bedingung mit Bereich(en)

```
-- SYNTAX
use sakila;
-- SELECT <welche_felder> FROM <welche_tabelle> WHERE
<wo_welches_feld_welchen_wert_hat>
-- Beispiel 1
SELECT actor_id, last_name FROM actor where actor_id > 8;
-- Beispiel 2
SELECT * FROM actor where actor_id > 8;
-- Beispiel 3
SELECT * FROM actor where actor_id > 8 and actor_id < 50;
```

### Zwei Bereiche abfragen

```
## Brackets are not necessary, works the same
select * from actor where (actor_id >= 8  and actor_id <=50) or (actor_id >= 100 and
```

```
actor_id <= 150)
```

### Select Beispiele mit Like

### Hintergrund Platzhalter '%' und '_'

- https://elearn.inf.tu-dresden.de/sqlkurs/lektion01/01_07_03_einschr_like.html

### Name fängt mit J an

```
## Alle Datensätze, die mit J anfangen
select first_name,last_name from actor where last_name like 'j%'
## mit ausgabe zusätzlichem String
select first_name,last_name,' ist der/die Beste' as bewertung from actor where
last_name like 'j%'
```

### Name hört mit n auf

```
select first_name,last_name from actor where last_name like '%n'
```

### Name beinhaltet 'q'

```
select first_name,last_name from actor where last_name like '%q%'
```

### Platzhalter für genau ein Zeichen (Linux/Windows -> ?)

```
## Alle Zeilen mit Last name McQ, dann genau einem beliebigen Zeichen und dann 'een'
SELECT * FROM sakila.actor where last_name like 'McQ_een'
```

## SELECT ORDER BY

### Syntax

```
-- Variante 1: (ohne where)
-- SELECT * FROM <welche_tabelle> ORDER BY <welches_feld>

-- Variante 2: (mit where)
-- SELECT * FROM <welche_tabelle> WHERE <welche_bedingung> ORDER BY <welches_feld>
```

### Beispiel ohne where

```
## feld aufsteigend
SELECT last_name,first_name,actor_id FROM sakila.actor ORDER BY last_name

## feld absteigend
SELECT last_name,first_name,actor_id FROM sakila.actor ORDER BY last_name desc

## erstes feld aufsteigend, zweites feld absteigend
SELECT last_name,first_name,actor_id FROM sakila.actor ORDER BY last_name,first_name
DESC
```

### Beispiel mit where

```
SELECT last_name,first_name,actor_id FROM sakila.actor WHERE last_name like 'J%' ORDER
BY last_name ASC,first_name DESC
```

### Unterschiede einfache und doppelte Hochkommas bei Oracle/MySQL

### MySQL

```
Hochkommas werden nur bei der Abfrage des Wertes verwendet, z.B

select * from actor where last_name like 'A%'
## das ist das gleiche wie:
select * from actor where last_name like "A%"
```

### MySQL - Wann nehme ich einfache, wann doppelte ?

```
## z.B. wenn ich ein Hochkomma in der Abfrage brauche, z.B
## damit besser lesbar für Admin/Entwickler
select * from actor where last_name like "O'Connor"
## Alternativ geht auch:
## Verfahren: Escapen
select * from actor where last_name like 'O\'Connor'
```

## Oracle:

```
## Für Feldname und Ausgabe Feldname (Alias) Doppelte hochkommas.
## z.B
## Hier immer das doppelte Hochkomma, weil es um den Identifier/Bezeichner geht
SELECT  'Hello, world!'    AS "My Greeting"

### Für String und Date - Werte einfache Hochkommas
select * from actor where last_name like 'A%'
```

## INSERT/UPDATE

### Praktisches Beispiel und erweitertes insert - INSERT

## Beispiel

```
INSERT INTO actor (first_name,last_name) values ('Joe','Manchos');
```

## Erweitertes Insert

```
## Mehrere Wertepaare einfügen - geht schneller als einzelne Inserts
INSERT INTO actor (first_name,last_name) values ('Joe','Metzgeros'),
('Hans','Mustermann');
```

## Referenz

- https://www.w3schools.com/sql/sql_insert.asp

### Praktisches Beispiel - Update

### Einfaches Beispiel ein Datensatz ändern

```
## Variante 1
UPDATE actor SET last_name = 'GUINESSA' WHERE actor_id = 1
## Variante 2 - 2 Felder ändern
UPDATE actor SET first_name='PENELOPEZ',last_name = 'GUINESS' WHERE actor_id = 1
```

### Referenz

- https://www.w3schools.com/sql/sql_update.asp

# DELETE

### Einfaches Delete Beispiel

### Example

```
DELETE FROM actor WHERE id = 200
```

### Reference

- https://www.mysqltutorial.org/mysql-delete-statement.aspx

# Datentypen

## Integer - INT - Datentypen

## Reference

- https://dev.mysql.com/doc/refman/8.0/en/integer-types.html

# Basics

### Connection to DB + exit

### General Explanation

- Step 1: connection to db
- Step 2: using specific database
- 1. 
  - 2. can be done in one step

### Connection as Root (without using -u/--user and db)

```
## If you are root and are connecting locally (socket), you do not need to enter a
passwort on root
## Why ?
mysql> use mysql
mysql> select user,host,plugin from user where user = 'root' and host = 'localhost';
```

```
root@mysql-server:~#whoami
root
## this work, because we are connecting locally
## by default mysql uses the user we are logged in with
mysql
```

### Connection with credentials

```
mysql -uroot -p
## passwort auf der Kommandozeile eingeben
```

### Connection to remote mysql - server

```
mysql -u root -p -h 10.10.9.117
```

### mysql-client

### Basics

```
mysql
mysql>

## Wie kommen wie raus ?
exit;
```

### Delimiter

```
Normalerweise ";"

Ist zum Trennen von Befehlen
```

### Use user and password automatically

```
nano /root/.my.cnf
## BE CAREFUL EVERYBODY CAN LOGIN AS ROOT TO MYSQL NOW
## in there
[mysql]
user=root
password=root-password-on-your-system
```

### Charset-Collations

### server system variablen abfragen

```
mysql> show session variables like '%hostname%';
+---------------+-------+
| Variable_name | Value |
+---------------+-------+
| hostname      | trn01 |
+---------------+-------+
1 row in set (0.00 sec)

mysql> select @@hostname;
+------------+
| @@hostname |
+------------+
| trn01      |
+------------+
1 row in set (0.00 sec)
```

## Storage Engines

### Which engine is used

```
show variables like '%default%';
```

## Working with the data modelling language (DML's)

### Working with INSERT

```
## Always use the field-names
INSERT INTO actor (first_name,last_name) values ('John','Smith');

## Extended inserts are quick (better than single inserts)
INSERT INTO actor (first_name,last_name) values ('John','Peters'),
('Mandy','Johnsson');
```

## Tipps & Tricks / Do Not

### Dump/SQL-File einspielen auf der Kommandozeile - Windows

```
mysql -u root -p < C:\Users\Admin\Downloads\test.sql
```

## Tools

### HeidiSQL Portable - works for windows

- https://www.heidisql.com/download.php?download=portable-64

## Tipps & Tricks

### Best Practice DBAL - Kochrezept

### Ausgangsituation

```
DBAL erstellt query
Query ist langsam
Was tun ?
```

### Steps 1+2

```
### An das SQL-Statement rankommen.

### 1. Analyse, warum ist Query langsam (kann ich von aussen etwas tun, um die Query
zu beeinflussen ohne sie zu ändern
explain <sql-statement>

### Sichtprüfung, fehlen Keys ??
##
##explain select vendor_city,vendor_state from contributions where vendor_first_name
like 'D%';
##+----+-------------+---------------+------------+------+---------------+------+-----
----+------+---------+----------+-------------+
##| id | select_type | table         | partitions | type | possible_keys | key  |
key_len | ref  | rows    | filtered | Extra       |
##+----+-------------+---------------+------------+------+---------------+------+-----
----+------+---------+----------+-------------+
##|  1 | SIMPLE      | contributions | NULL       | ALL  | NULL          | NULL | NULL
| NULL | 2028402 |    11.11 | Using where |
##+----+-------------+---------------+------------+------+---------------+------+-----
----+------+---------+----------+-------------+
## Gibt es bei dem type einen Eintrag ALL.

### Oder da ist ein key drin, aber der wird garnicht verändert.

### Index setzen
```

### Step 3.

```
Query analysieren -> Schritt debuggen.
1) Links -> Rechts: Entweder von Links (sprich: was sind die ersten Daten, die ich
brauche, welche dann, welche dann usw.)
```

```
2) Rechts -> Links -> immer mehr wegnehmen und gucken, ob es schneller wird.
```

### Step 4:

```
index hint.
```

### Step 5: Customized Query

## Extra (Optional)

## Übungen

### Übung Update/Insert

```
1. In einer Anweisung alle Datensätze ändern in denen der erste Name JUDY und der
Nachname DEAN ist -> dort Vorname in JAMES ändern.

UPDATE actor SET first_name = 'JAMES' where last_name='DEAN' and first_name='JUDY';

2. In einem SQL-Statement 2 neue Datensätze einfügnen. 1. Mann, Josef  2. Mannheim,
Martha

INSERT INTO actor (first_name, last_name) values ('Mann','Josef'),
('Mannheim','Martha');
```
