- 9. INDEX HINTS
 - Force use of an Index
 - o Do not use an index if indexes are present
- 10. PREPARED STATEMENTS
 - Prepared Statements with examples
 - o Prepared Statements and transactions
- 11. TRIGGERS
 - o <u>Triggers</u>
- 12. EVENTS
 - Events
- 13. FUNCTIONS

- Functions with example
- 14. STORED PROCEDURES
 - o Create Procedure
 - o <u>lf</u>
 - o <u>Cursors</u>
 - Cursor with Params
 - o Loop
 - o <u>Case</u>
 - o <u>Cursor</u>
 - o Continue Handler Example
 - Exit Handler Example
 - o <u>Custom Error message</u>
- 15. ERRORS
 - Error Codes List
- 16. LOCKS
 - o InnoDB Implicit Locks
 - SELECT FOR UPDATE
- 17. sys (Database included since MariaDB 10.6 AFAIK)
 - o show innodb locks with sys
- 18. Formatierung Ausgaben / Funktionen
 - o <u>Datumsausgabe formatieren</u>
 - o Strings zusammenfügen
- 19. Partitions
 - Maintain Partitions and Explain
- 20. Performance
 - * vs. specific field in field list select
 - o Möglichst keine Funktion in where (spalte) verwenden
 - o <u>SQL-Rewrite Pager- Subselect</u>
- 21. Analyzing Slow Queries / Indexes
 - o Create unique index
 - Find indexes
 - Create Index/Delete/Drop Index
 - o <u>Indizes</u>
 - o <u>Explain</u>
 - profiling-get-time-for-execution-of.query
 - Kein function in where verwenden
 - o Optimizer-hints (and why you should not use them)
 - Query-Plans aka Explains
 - o Query Pläne und die Key-Länge
 - o Index und Likes
 - Index und Joins
 - Find out cardinality without index
 - Index and Functions

- o Index neu aufbauen?
- o Index Stats

22. Tools

- Percona Toolkit
- o pt-query-digest analyze slow logs
- o pt-online-schema-change howto
- o Example sys-schema and Reference
- Profiling
- 23. o Backup und Restore
- 24. Tipps & Tricks
 - o Dummy table DUAL
 - Wie kann ich verwendete Storage Engine rausfinden Table
 - SHOW VARIABLES WITH WHERE
 - Schnellster Import von Daten mit csv
 - Queries in Datenbank (mysql) loggen, die keine Indizes verwenden
 - Workaround Materialized View
 - o Zeichensatz umstellen

25. Storage Engines

- MylSAM Key Buffer
- 26. References/Documentation
 - o MySQL/MariaDB Performance Document
 - o MariaDB Changes in 10.6
 - MariaDB Installation Linux mit Repos
 - o JDBC-Treiber

27. Oracle

- 8. References
 - Examples Left Join
 - Notes on Specific MySQL Knowledge
 - o Many Sakila Example Queries
 - Helpful Examples
- 9. Extra (Optional)
- 10. Übungen
 - Übung Update/Insert

Technical Background

Technical Structure

Process of Queries

Beispieldaten / Testserver

Sakila

```
cd /usr/src
wget https://downloads.mysql.com/docs/sakila-db.tar.gz
tar xzvf sakila-db.tar.gz

cd sakila-db
mysql < sakila-schema.sql
mysql < sakila-data.sql</pre>
```

Spendenliste

Walkthrough (Debian/Ubuntu 18.04. with mysql 5.7.)

• Complete process takes about 10 minutes

```
cd /usr/src;
apt update; apt install git;
git clone https://github.com/jmetzger/dedupe-examples.git;
cd dedupe-examples;
cd mysql_example;
## Eventually you need to enter (in mysql_example/mysql.cnf)
## Only necessary if you cannot connect to db by entering "mysql"
## password=<your_root_pw>
./setup.sh
```

Walkthrough (Debian/Ubuntu 20.04. with mysql 8)

• Complete process takes about 10 minutes

```
cd /usr/src;
apt update; apt install git;
git clone https://github.com/jmetzger/dedupe-examples.git;
cd dedupe-examples;
cd mysql_example;
## otherwice script does not work
echo "set local_infile=1" | mysql
## Eventually you need to enter (in mysql_example/mysql.cnf)
## Only necessary if you cannot connect to db by entering "mysql"
## password=<your_root_pw>
./setup.sh
```

Server Vagrant

```
## Put this in a Vagrantfile
## 1. mkdir project; cd project
## 2. Put this in a Vagrantfile
## 3. vagrant up
## 4. vagrant ssh
Vagrant.configure("2") do |config|
 config.vm.box = "ubuntu/focal64"
 config.vm.provision "shell", inline: <<-SHELL</pre>
   apt-get update
   apt-get install -y mysql-server-8.0 wget
   cd /usr/src
   wget https://downloads.mysql.com/docs/sakila-db.tar.gz
   tar xzvf sakila-db.tar.gz
   cd sakila-db
   mysql < sakila-schema.sql</pre>
   mysql < sakila-data.sql</pre>
   echo "-- Setting up external user"
   echo "CREATE USER ext@'%' identified by 'student'" | mysql
   echo "GRANT ALL PRIVILEGES ON *.* TO ext@'%'" | mysql
   echo "-- Setting mysql up for external access"
   echo "bind-address = 0.0.0.0" >> /etc/mysql/mysql.conf.d/mysqld.cnf
   systemctl restart mysql
   echo "-- Setting up contributions database - big data"
   cd /usr/src;
   apt-get install -y git
   git clone https://github.com/jmetzger/dedupe-examples.git;
   cd dedupe-examples;
   cd mysql example;
   echo "set global local infile = 1" | mysql
   echo "# Eventually you need to enter (in mysql example/mysql.cnf)"
   echo '\# Only necessary if you cannot connect to db by entering "mysql"'
   echo '# password=<your root pw>'
   ./setup.sh
   date
   echo "-- Done - Setting up contributions database - big data"
 SHELL
end
```

JOINS

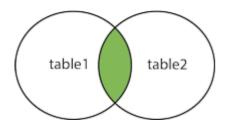

Basics of Joins

What is a JOIN for?

- combines rows from two or more tables
- based on a related column between them.

MySQL (Inner) Join

INNER JOIN

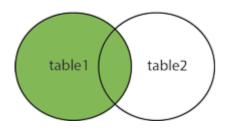

MySQL (Inner) Join (explained)

- Inner Join and Join are the same
- Returns records that have matching values in both tables
- Inner Join, Cross Join and Join
 - o are the same in MySQL

MySQL Left Join

LEFT JOIN

MySQL Left (outer) Join (explained)

- Return all records from the left table
- AND the matched records from the right table
- The result is NULL on the right side
 - o if there are no matched columns on the right
- Left Join and Left Outer Join are the same

MySQL Right Join

RIGHT JOIN table2

MySQL Right Join (explained)

- Return all records from the right table
 - AND the matched records from the left table
- Right Join and Right Outer Join are the same

MySQL Straight Join

- MySQL (inner) Join and Straight Join are the same
- Difference:
 - o The left column is always read first
- Downside:
 - Bad optimization through mysql (query optimizer)
- Recommendation:
 - o Avoid straight join if possible
 - o use join instead

Type of Joins

- [inner] join
 - o inner join and join are the same
- left [outer] join
- right [outer] join
- full [outer] join
- straight join < equals > join
- cross join = join (in mysql)
- natural join <= equals => join (but syntax is different)

In Detail: [INNER] JOIN

- Return rows when there
 - o is a match in both tables
- Example

```
SELECT actor.first_name, actor.last_name, film.title

FROM film_actor

INNER JOIN actor ON film_actor.actor_id = actor.actor_id

INNER JOIN film ON film_actor.film_id = film.film_id;
```

In Detail: Joining without JOIN - Keyword ====

• Explanation: Will have the same query execution plan as [INNER] JOIN

```
SELECT actor.first_name, actor.last_name, film.title
FROM film_actor,actor,film
where film_actor.actor_id = actor.actor_id
and film_actor.film_id = film.film_id;
```

In Detail: Left Join

- Return all rows from the left side
 - o even if there is not result on the right side
- Example

```
SELECT
c.customer_id,
c.first_name,
c.last_name,
a.actor_id,
a.first_name,
a.last_name
FROM customer c
LEFT JOIN actor a
ON c.last_name = a.last_name
ORDER BY c.last_name;
```

In Detail: Right Join

- Return all rows from the right side
 - o even if there are no results on the left side
- Example

```
SELECT
c.customer_id,
c.first_name,
c.last_name,
a.actor_id,
a.first_name,
a.last_name
FROM customer c
RIGHT JOIN actor a
ON c.last_name = a.last_name
ORDER BY a.last_name;
```

In Detail: Having

- Simple: WHERE for GroupBy (because where does not work here)
- Example

```
SELECT last_name, COUNT(*)
FROM sakila.actor
GROUP BY last_name
HAVING count(last_name) > 2
```

Internal (type of joins) - NLJ

• NLJ - (Nested Loop Join)

```
for each row in t1 matching range {
  for each row in t2 matching reference key {
  for each row in t3 {
    if row satisfies join conditions, send to client
  }
  }
}
```

Internal (type of joins) - BNL

- BNL (Block Nested Loop)
 - o in explain: -> using join buffer
 - o columns of interest to a join are stored in join buffer
 - --> not whole rows.
 - join_buffer_size system variable
 - -> determines the size of each join buffer used to process a query.
- https://dev.mysql.com/doc/refman/5.7/en/nested-loop-joins.html

| 1 | PRIMARY | SE | ALL | PRIMARY | NULL | NULL | NULL

BNL - Who can I see, if it is used?

· Can be seen in explain

```
explain SELECT a.* FROM actor a INNER JOIN actor b where a.actor_id > 20 and
b.actor_id < 20</pre>
```

5 | Using where; Using join buffer (Block Nested Loop)

```
When using a Block Nested-Loop Join, MySQL will, instead of automatically joining t2, insert as many rows from t1 that it can into a join buffer and then scan the appropriate range of t2 once, matching each record in t2 to the join buffer.

From here, each matched row is then sent to the next join, which, as previously discussed, may be another table, t3, or, if t2 is the last table in the query, the rows may be sent to the network.
```

BNL's - Refs:

• https://www.burnison.ca/notes/fun-mysql-fact-of-the-day-block-nested-loop-joins

Working with LEFT JOIN

General

- Show all entries from the left table and only from the right if available
- Examples are based on sakila database.

Example - new language / not in language table

```
SELECT @@foreign_key_checks;

SET FOREIGN_KEY_CHECKS=0

UPDATE film SET language_id = 99 WHERE film_id >= 800 and film_id <= 899

SELECT f.film_id,f.title,f.description,l.name FROM film f LEFT JOIN language l ON f.language_id = 1.language_id;

SET FOREIGN_KEY_CHECKS=1
```

Example

Join examples

```
## Work - step by step.
SELECT * FROM film f;
SELECT f.title FROM film f;
SELECT f.language_id FROM film f JOIN language 1 ON f.language_id = l.language_id;
-- aus film-tabelle alle felder - f.*
SELECT f.*,l.name FROM film f JOIN language 1 ON f.language_id = l.language_id;
SELECT f.film_id,f.title,l.name,f.description FROM film f JOIN language 1 ON f.language_id = l.language_id;
```

GROUP BY

Simple Group By Example

```
## Variante 1
SELECT last_name, COUNT(last_name) as cnt FROM actor GROUP BY last_name

## Variante 2: ohne Group - akroyd zählen -> geht nur bei einem Namen
SELECT last_name, COUNT(last_name) as cnt FROM actor WHERE last_name = 'AKROYD'

## Das ist falsch - weil mehrere Namen, Ausgabe nur eine Zeile
SELECT last_name, COUNT(last_name) as cnt FROM actor WHERE last_name = 'AKROYD' or
last_name = 'ALLEN'

## Variante 2a (Erst Daten holen - 6 Datensätze, dann aggregieren (group by)

## Für grosse Datenmengen besser !
SELECT last_name, COUNT(last_name) as cnt FROM actor WHERE last_name = 'AKROYD' or
last_name = 'ALLEN' GROUP BY last_name

## Variante 2b (Alle Daten holen - 200 Datensätze, dann alles aggregieren)
SELECT last_name, COUNT(last_name) as cnt FROM actor GROUP BY last_name HAVING
last_name = 'AKROYD' or last_name = 'ALLEN'
```

Join and group - example

CONSTRAINTS

Foreign Key Constraints - Example

Walkthrough

Step 1: Sample Table and data

```
create table gadget types(
   type_id int auto_increment,
   name varchar(100) not null,
   primary key(type_id)
);
insert into gadget types(name)
   ('Entertainment'),
    ('Computing'),
   ('Communication'),
    ('Lifestyle'),
    ('Cameras');
create table gadgets(
   gadget_id int auto_increment,
   gadget_name varchar(100) not null,
   type_id int,
   primary key(gadget id),
   constraint fk_type
   foreign key(type id)
      references gadget_types(type_id)
);
```

Step 2: Insert data to gadgets

```
insert into
    gadgets(gadget_name,type_id)
values
    ('Amazon Kindle',1),
    ('Apple iPod',1),
    ('Audio Highway Listen Up',1),
    ('Apple iPad',2),
    ('MicroSD',2),
    ('MicroSD',2),
    ('BlackBerry 6210',3),
    ('Pager',3),
    ('Pager',3),
    ('Credit Card',4),
    ('Credit Card',4),
    ('Zippo',4),
    ('Casio G-Shock DW-5000C',4),
```

```
('Nikon F',5),
('Canon EOS 5D Mark II',5);
```

Step 3 - Try to delete

```
delete from gadget_types
where type_id = 1;

SQL Error (1451): Cannot delete or update a parent row: a foreign key constraint fails
(`nation`.`gadgets`, CONSTRAINT `fk_type` FOREIGN KEY (`type_id`) REFERENCES
`gadget_types` (`type_id`))
--> To delete a row from the gadget_types table, you need to remove all the
referencing rows from the gadgets table first.
```

Step 4 - Drop Contrains and set NULL Reference

```
alter table gadgets
drop constraint fk_type;

alter table gadgets
add constraint fk_type
foreign key(type_id)
    references gadget_types(type_id)
    on delete set null
    on update set null;

delete from gadget_types
where type_id = 1;

select * from gadgets;
--> As shown clearly from the output, the values in the type_id column of rows with type_id 1 from the gadgets table were set to null because of the on delete set null option.
```

Step 5 - change id in gadget_types

```
update gadget_types
set type_id = 20
where type_id = 2;
select * from gadgets;

--> The values in the type_id column of rows with type_id 2 from the gadgets table
were set to null because of the on update set null option.
```

Step 6 - remove orphans

```
delete from gadgets
where type_id is null;
```

Step 7 - cascade reference option

```
-- Drop constraint
alter table gadgets
drop constraint fk_type;

alter table gadgets
add constraint fk_type
foreign key(type_id)
    references gadget_types(type_id)
    on delete cascade
    on update cascade;

delete from gadget_types
where type_id = 3;
--> MariaDB automatically deleted rows from the gadgets table whose type_id is 3
because of the on delete cascade action.

select * from gadgets;
```

Step 8 - Update gadget_type id 4 to 40:

```
update gadget_types
set type_id = 40
where type_id = 4

--> MariaDB automatically updated rows from the gadgets table whose type_id is 4 to 40
because of the on update cascade action:

select * from gadgets;
--> Updated all references
```

• https://www.mariadbtutorial.com/mariadb-basics/mariadb-foreign-key/

Check constraint with example

Column constraints

```
create table classes(
    class_id int auto_increment,
    class_name varchar(255) not null,
    student_count int
        constraint positive_student_count
        check(student_count >0),
    primary key(class_id)
);
```

Table Check Constraint

```
create table classes(
    class_id int auto_increment,
    class_name varchar(255) not null,
    student_count int,
    constraint positive_student_count
        check(student_count >0),
    primary key(class_id)
);

insert into classes(class_name, student_count)
values('MariaDB for Developers',0);

SQL Error (4025): CONSTRAINT `positive_student_count` failed for `nation`.`classes`
insert into classes(class_name, student_count)
values('MariaDB for Developers',100);
```

Multi Column Constraint

```
create table classes(
    class_id int auto_increment,
    class_name varchar(100) not null,
    begin_date date not null,
    end_date date not null,
    student_count int,
    constraint positive_student_count
        check(student_count >0),
    constraint valid_date
        check(end_date >= begin_date),
    primary key(class_id)
);

-- Change structure like so
ALTER TABLE classes ADD (begin_date date NOT NULL, end_date date NOT NULL,
CONSTRAINT valid_date CHECK (end_date > begin_date))
```

--

Ref:

• https://www.mariadbtutorial.com/mariadb-basics/mariadb-check-constraint/

UPDATE

Sophisticated Update

Aufgabe

```
Erhöhe bei allen Datensätzen in film die rental_rate um 1 Euro, für die Schauspieler "actor", deren Nachname mit D anfängt
```

Lösung

```
SELECT DISTINCT fc.film_id FROM filmcopy fc JOIN film_actor fa ON fc.film_id = fa.film_id JOIN actor a ON fa.actor_id = a.actor_id where a.last_name like 'D%';

UPDATE filmcopy fc JOIN film_actor fa ON fc.film_id = fa.film_id JOIN actor a ON fa.actor_id = a.actor_id SET rental_rate = rental_rate + 1

Query OK, 432 rows affected (0.02 sec)

Rows matched: 432 Changed: 432 Warnings: 0
```

DELETE

Delete mit Transaktion

Beispiel

```
Variante 1: Andere sehen es erst nach commit (andere Sessions/Verbindungen)

BEGIN;

DELETE FROM actor where actor_id = 200;

COMMIT;

Variante 2: Aktion mir nicht, ich rolle sie zurück, mache sie rückgängig

BEGIN;

DELETE FROM actor where actor_id = 200;

ROLLBOCK;
```

CONSTRAINTS

Constrains with Example Walkthrough

INDEX HINTS

Force use of an Index

```
EXPLAIN SELECT Name, CountryCode FROM City FORCE INDEX (Name) WHERE name>="A" and CountryCode >="A";
```

EXPLAIN SELECT Name, CountryCode FROM City USE INDEX (Name) WHERE name>="A" and CountryCode >="A";

Do not use an index if indexes are present

```
SELECT * FROM actor USE INDEX() WHERE last_name LIKE 'D%';
-- Identify if really no index is used

EXPLAIN SELECT * FROM actor USE INDEX() WHERE last_name LIKE 'D%';
```

PREPARED STATEMENTS

Prepared Statements with examples

Setup

```
CREATE TABLE test (id int auto_increment, data varchar(40) NOT NULL DEFAULT '', PRIMARY KEY(id));
```

Single Line (Insert)

```
USE sakila;

PREPARE st1 FROM 'INSERT INTO actor (first_name, last_name) VALUES (?,?)';

SET @first_name = 'Johan';

SET @last_name = 'Muster';

EXECUTE st1 USING @first_name, @last_name;

DEALLOCATE PREPARE st1;

SELECT * FROM actor ORDER BY actor_id DESC;
```

Multiline Prepared Statement (Insert)

```
-- Statement vorbereiten

PREPARE stmt1 FROM 'INSERT INTO test (data) VALUES (?), (?), (?)';

SET @d1 = 'Line1';

SET @d2 = 'Line2';

SET @d3 = 'Line3';

EXECUTE stmt1 USING @d1, @d2, @d3;

-- If you do not want to use it anymore DEALLOCATE IT

DEALLOCATE PREPARE stmt1;

SELECT * from test;
```

Using it with select

```
+----+
| 3 | three |
+----+
deallocate prepare test;
```

Finding out number of rows (for select)

```
-- If this function is executed immediately after execute.

SELECT FOUND_ROWS();
```

Prepared Statements and transactions

```
use sakila;
create table test if not exists (id int auto_increment, data varchar(30), primary
key(id));
START TRANSACTION;
PREPARE stmt2 FROM 'INSERT INTO test (`data`) VALUES (?)';
SET @d1 = 'Line1';
EXECUTE stmt2 USING @dl;
SET @d1 = 'Line2';
EXECUTE stmt2 USING @dl;
COMMIT;
SELECT * from test;
BEGIN;
SET @d1 = 'Line3 -uncommited';
EXECUTE stmt2 USING @d1;
ROLLBACK;
DEALLOCATE PREPARE stmt2;
SELECT * FROM test;
```

References

• https://mariadb.com/kb/en/prepare-statement/

TRIGGERS

Triggers

Create the structure

```
create table countries (
  country id int auto increment,
  name varchar(50) not null,
   primary key(country id)
);
INSERT INTO countries (name) values ('Germany'), ('Austria');
create table country_stats(
  country_id int,
   year int,
   population int,
   primary key (country id, year),
   foreign key(country_id)
   references countries (country id)
);
INSERT INTO country_stats (country_id, year, population) values (1,2020,100000);
create table population logs(
   log_id int auto_increment,
   country id int not null,
   year int not null,
   old_population int not null,
   new population int not null,
   updated_at timestamp default current_timestamp,
   primary key(log_id)
);
```

Create the trigger

```
new.population
);
```

Create trigger (the same) but with BEGIN/END - Block

```
create trigger before_country_stats_update
   before update on country_stats
   for each row
   BEGIN
   SET @anfang = 1;
   insert into population_logs(
      country_id,
       year,
      old_population,
      new_population
   values(
      old.country_id,
      old.year,
      old.population,
      new.population
   );
   END
```

Run a test

```
update
    country_stats
set
    population = 1352617399
where
    country_id = 1 and
    year = 2020;
-- what's the new result
select * from population_logs;
```

Ref:

• https://mariadb.com/kb/en/trigger-overview/

EVENTS

Events

Preparation

```
-- scheduler is not there
SHOW PROCESSLIST;

-- Prüfen ob scheduler läuft
show variables like '%event%';
set GLOBAL event_scheduler = on;

-- scheduler appears
SHOW PROCESSLIST;

-- Events anzeigen
show events;
```

preparation

```
USE schulung;

CREATE TABLE messages (
   id INT PRIMARY KEY AUTO_INCREMENT,
   message VARCHAR(255) NOT NULL,
   created_at DATETIME NOT NULL
);
```

One time event

```
USE schulung
CREATE EVENT IF NOT EXISTS test_event_01
ON SCHEDULE AT CURRENT_TIMESTAMP
DO
    INSERT INTO messages(message, created_at)
    VALUES('Test MariaDB Event 1',NOW());
SELECT * FROM messages;
```

Show all events from a specific database

```
SHOW EVENTS FROM schulung;
```

Show all events in active database

```
USE schulung;
SHOW EVENTS;
```

One time event but preserved (so runs once every minute)

```
To keep the event after it is expired, you use the ON COMPLETION PRESERVE clause.

CREATE EVENT test_event_02

ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL 1 MINUTE

ON COMPLETION PRESERVE

DO

INSERT INTO messages(message,created_at)

VALUES('Test MariaDB Event 2',NOW());
```

Same version, but with begin end block

```
DELIMITER /
CREATE EVENT test_event_03
ON SCHEDULE AT CURRENT_TIMESTAMP + INTERVAL 1 MINUTE
ON COMPLETION PRESERVE
DO
    BEGIN
    INSERT INTO messages(message,created_at)
    VALUES('Test MariaDB Event 3',NOW());
    END /
DELIMITER;
SELECT * FROM messages;
```

Recurring Example

```
CREATE EVENT test_event_03
ON SCHEDULE EVERY 1 MINUTE
STARTS CURRENT_TIMESTAMP
ENDS CURRENT_TIMESTAMP + INTERVAL 1 HOUR
DO
    INSERT INTO messages (message, created_at)
    VALUES('Test MariaDB recurring Event', NOW());

SELECT * FROM messages;

// after 1 minute
SELECT * FROM messages;
```

Drop an event

```
DROP EVENT IF EXIST test_event_03;
```

Set event-scheduler in config / my.cnf / my.ini

```
[mysqld]
event-scheduler

## after that restawrt
systemctl restart mariadb
```

Fix timezone problem Linux (when time is displayed wrong)

```
## 09:32 UTC should be 11:32 CEST
## also root ausführen
timedatectl list-timezones | grep 'Europe/Berlin';
timedatectl set-timezone Europe/Berlin
timedatectl
date
systemctl restart mariadb
mysql
mysql>select now();
mysql>--- time should ok now
```

FUNCTIONS

Functions with example

Example 1

```
CREATE FUNCTION hello (s CHAR(20))

RETURNS CHAR(50) DETERMINISTIC

RETURN CONCAT('Hello, ',s,'!');
```

Example 2

```
DELIMITER //
CREATE FUNCTION CalcValue ( starting_value INT )
RETURNS INT DETERMINISTIC

BEGIN

DECLARE total_value INT;

SET total_value = 0;

label1: WHILE total_value <= 3000 DO
    SET total_value = total_value + starting_value;
END WHILE label1;

RETURN total_value;

END; //

DELIMITER;

-- Use it
SELECT CalcValue (1000);</pre>
```

Example 3 (Mit Variable anzahl vorher setzen)

```
DELIMITER /

CREATE DEFINER=`ext`@`%` FUNCTION `Anzahl`(
        `starting_value` INT
)

RETURNS INT

BEGIN

DECLARE total_value INT;
DECLARE anzahl INT;
-- SET total_value = 0;
SELECT COUNT(*) INTO anzahl FROM actor;
```

```
-- WHILE total_value <= 3000 DO
-- SET total_value = total_value + starting_value;
-- END WHILE;
-- RETURN total_value;
RETURN anzahl;
```

Example 3 (Direkt in @anzahl schreiben)

```
DELIMITER /

CREATE DEFINER=`ext`@`%` FUNCTION `schaupieler`(
        `starting_value` INT
)

RETURNS INT

BEGIN

DECLARE total_value INT;
    SELECT COUNT(*) INTO @anzahl FROM actor;
    RETURN @anzahl;

END/
```

• https://mariadb.com/kb/en/create-function/

STORED PROCEDURES

Create Procedure

Example

```
USE sakila;
DELIMITER //

CREATE PROCEDURE simpleproc (OUT param1 INT)
BEGIN
SELECT COUNT(*) INTO param1 FROM actor;
END;
//

DELIMITER;

CALL simpleproc(@a);

SELECT @a;
+-----+
| @a |
+-----+
| 1 | 1 |
+-----+
```

Reference

• https://mariadb.com/kb/en/create-procedure/

Example 1

```
-- Gibt 1 aus
-- SELECT werden auf dem Bildschirm angezeigt ;o)

DELIMITER $$
USE sakila $$
DROP PROCEDURE IF EXISTS my_sproc $$
CREATE PROCEDURE
my_sproc ()
BEGIN
    IF 1=1
    THEN
        SELECT 1;
    END IF;
END IF;
END $$

CALL my_sproc
```

Example 2

```
DELIMITER $
CREATE PROCEDURE my_pr()

BEGIN

IF 2 = 2 THEN

SELECT 'TRUE';

ELSE

SELECT 'FALSE';

END IF;

END $
DELIMITER;

CALL my_pr;
```

Example 3

```
DELIMITER /
CREATE OR REPLACE PROCEDURE addActor (IN startdate DATE, IN enddate DATE)
main: BEGIN
    If startdate > enddate
    THEN
        SELECT 'Das Startdaum liegt nach dem Enddatum';
        LEAVE main;
    END IF;

SELECT 'das passt';

END/
DELIMITER;
```

Cursors

Example 1:

```
CREATE DATABASE IF NOT EXISTS training;
USE training;
CREATE TABLE c1(i INT);
CREATE TABLE c2(i INT);
CREATE TABLE c3(i INT);
DELIMITER //
CREATE PROCEDURE p1()
BEGIN
 DECLARE done INT DEFAULT FALSE;
 DECLARE x, y INT;
 DECLARE curl CURSOR FOR SELECT i FROM c1;
 DECLARE cur2 CURSOR FOR SELECT i FROM c2;
  DECLARE CONTINUE HANDLER FOR NOT FOUND SET done = TRUE;
 OPEN cur1;
 OPEN cur2;
 read_loop: LOOP
   FETCH curl INTO x;
   FETCH cur2 INTO y;
   IF done THEN
    LEAVE read loop;
   END IF;
   IF x < y THEN
    INSERT INTO c3 VALUES (x);
    INSERT INTO c3 VALUES (y);
   END IF;
 END LOOP;
 CLOSE cur1;
 CLOSE cur2;
END; //
DELIMITER ;
INSERT INTO c1 VALUES(5), (50), (500);
INSERT INTO c2 VALUES(10),(20),(30);
CALL p1;
SELECT * FROM c3;
```

Example 2

```
CREATE OR REPLACE PROCEDURE getActorNames(p ab CHAR(1))
BEGIN
 DECLARE d_full_name VARCHAR(90);
 DECLARE done INT DEFAULT FALSE;
 DECLARE curl CURSOR FOR SELECT CONCAT(last_name,',',',first_name) FROM actor where

Continue Handler Example

Example 1 (Handler without begin end)

```
-- In heidisql
DELIMITER /
CREATE OR REPLACE PROCEDURE handlertest()
 DECLARE CONTINUE HANDLER FOR 1146
  SELECT 'Sorry mate, wrong table';
 SELECT actor id FROM wrong table name;
 SELECT 'continue';
 SELECT * FROM actor WHERE actor id = 1;
END /
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
MariaDB [sakila] > CALL handlertest;
+----+
| Sorry mate, wrong table |
+----+
| Sorry mate, wrong table |
+----+
1 row in set (0.001 sec)
| continue |
| continue |
+----+
1 row in set (0.001 sec)
+----+
| actor_id | first_name | last_name |
+----+
      1 | PENELOPE | GUINESS |
+----+
1 row in set (0.003 sec)
Query OK, 0 rows affected (0.003 sec)
MariaDB [sakila]>
```

Example 2: with begin and end (handler)

```
-- Important: At the end of th BEGIN END; block for DECLARE CONTINUE .. -- There has to be an ";" at then end of END -> END;
```

```
DELIMITER /
CREATE OR REPLACE PROCEDURE handlertest()
 DECLARE CONTINUE HANDLER FOR 1146
  SELECT 'Sorry mate, wrong table';
 END;
 SELECT actor_id FROM wrong_table_name;
 SELECT 'continue';
 SELECT * FROM actor WHERE actor_id = 1;
END /
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
select
MariaDB [sakila] > CALL handlertest;
+----+
| Sorry mate, wrong table |
+----+
| Sorry mate, wrong table |
+----+
1 row in set (0.001 sec)
| continue |
| continue |
+----+
1 row in set (0.001 sec)
+----+
| actor_id | first_name | last_name |
+----+
      1 | PENELOPE | GUINESS |
+----+
1 row in set (0.003 sec)
Query OK, 0 rows affected (0.003 sec)
MariaDB [sakila]>
```

Exit Handler Example

Example 1 (Handler without begin end)

```
-- In heidisql
DELIMITER /
CREATE OR REPLACE PROCEDURE handlertest()
 DECLARE EXIT HANDLER FOR 1146
  SELECT 'Sorry mate, wrong table';
 SELECT actor id FROM wrong table name;
 SELECT 'continue';
 SELECT * FROM actor WHERE actor_id = 1;
END /
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
select
MariaDB [sakila]();
+----+
| Sorry mate, wrong table |
+----+
| Sorry mate, wrong table |
+----+
1 row in set (0.001 sec)
Query OK, 0 rows affected (0.002 sec)
```

Example 2: with begin and end (handler)

```
-- Important: At the end of th BEGIN END; block for DECLARE CONTINUE ..

-- There has to be an ";" at then end of END -> END;

DELIMITER /

CREATE OR REPLACE PROCEDURE handlertest()

BEGIN

DECLARE EXIT HANDLER FOR 1146

BEGIN

SELECT 'Sorry mate, wrong table';

END;

SELECT actor_id FROM wrong_table_name;

SELECT 'continue';

SELECT * FROM actor WHERE actor_id = 1;
```

```
-- Execute the CALL in an mysql - client to really see, what is going on
-- In heidisql and other guis you will probably only see the output of the first
select
MariaDB [sakila]();
+-----+
| Sorry mate, wrong table |
+-----+
| Sorry mate, wrong table |
+-----+
1 row in set (0.001 sec)

Query OK, 0 rows affected (0.002 sec)
```

Custom Error message

Variante 1

```
USE `sakila`;
DROP PROCEDURE IF EXISTS actortest;
DELIMITER /
CREATE OR REPLACE PROCEDURE actortest(OUT n actor id INT)
BEGIN
    DECLARE EXIT HANDLER FOR SQLEXCEPTION
   BEGIN
     GET DIAGNOSTICS CONDITION 1 @SQLSTATE = RETURNED SQLSTATE,
    @errno = MYSQL ERRNO, @TEXT = MESSAGE TEXT;
    SET @full_error = CONCAT("ERROR ", @errno, " (", @SQLSTATE, "):", @TEXT);
    SELECT @full error;
   END;
   SELECT actor id INTO n actor id FROM NOT actor ctor WHERE actor id = 1;
    -- SET n actor id = 55;
END; /
DELIMITER ;
```

Variante 2: Mit Schreiben in log-tabelle

```
USE `sakila`;
CREATE TABLE IF NOT EXISTS applogs (id INT AUTO_INCREMENT, message MEDIUMTEXT, PRIMARY
KEY(id));
DROP PROCEDURE IF EXISTS actortest;
DELIMITER /
CREATE OR REPLACE PROCEDURE actortest(OUT n_actor_id INT)
BEGIN
   DECLARE EXIT HANDLER FOR SQLEXCEPTION
   GET DIAGNOSTICS CONDITION 1 @SQLSTATE = RETURNED SQLSTATE,
    @errno = MYSQL ERRNO, @TEXT = MESSAGE TEXT;
    SET @full_error = CONCAT("ERROR ", @errno, " (", @SQLSTATE, "):", @TEXT);
    INSERT INTO applogs (message) VALUES (@full error);
    SELECT @full error;
    END;
   SELECT actor_id INTO n_actor_id FROM NOT_actor_ctor WHERE actor_id = 1;
    -- SET n_actor_id = 55;
```

END; /

DELIMITER ;

ERRORS

Error Codes List

• https://mariadb.com/kb/en/mariadb-error-codes/

LOCKS

InnoDB Implicit Locks

How do the work in general

- Implicit locks are done by InnoDB itself
- We can only partly influence them.

Who wants what?

```
<who?, what?, how?, granted?>
```

Explanation (a bit clumsy)

- IS and IX (intended share an intended write lock)
- . IS and IX can be trigged on SQL
- IX -> SUFFIX -> FOR UPDATE (this triggers a IX lock)
- IX and IS are the first step (on table layer)
- After that IX -> tries to get an write lock on row-level -> X
- Works unless there is another X
- IX and IS is not retrieved on TABLE spaced operations (construction --- alter)

Lock Type compability matrix

```
X IX S IS
X Conflict Conflict Conflict
IX Conflict Compatible Conflict Compatible
S Conflict Compatible Compatible Compatible
IS Conflict Compatible Compatible Compatible
```

The best explanation across the internet ;o)

• http://stackoverflow.com/questions/25903764/why-is-an-ix-lock-compatible-with-another-ix-lock-in-innodb|IX_and_IS-locks

```
Many people, both visitors and curators, enter the museum.

The visitors want to view paintings, so they wear a badge labeled "IS".

The curators may replace paintings, so they wear a badge labeled "IX".

There can be many people in the museum at the same time, with both types of badges.

They don't block each other.

During their visit, the serious art fans will get as close to the painting as they can,

and study it for lengthy periods.

They're happy to let other art fans stand next to them before the same painting.

They therefore are doing SELECT ... LOCK IN SHARE MODE and they have "S" lock,
```

because they at least don't want the painting to be replaced while they're studying it.

The curators can replace a painting, but they are courteous to the serious art fans, and they'll wait until these viewers are done and move on.

So they are trying to do SELECT \dots FOR UPDATE (or else simply UPDATE or DELETE). They will acquire "X" locks at this time, by hanging a little sign up saying "exhibit being redesigned."

The serious art fans want to see the art presented in a proper manner, with nice lighting and some descriptive placque.

They'll wait for the redesign to be done before they approach (they get a lock wait if they try).

SELECT FOR UPDATE

Important

• It only locks (X) the rows needed, not the complete table

When is it used?

• You want to be sure, a specific dataset will not be changed

Example

```
create database if not exists training;
use training;
create table rooms (room id tinyint auto increment, room varchar(20), primary
key(room id));
create table bookings (booking_id int auto_increment, room_id tinyint, name
varchar(20), primary key(booking_id));
insert into rooms (room) values ('Honeymoon');
insert into rooms (room) values ('Sunset');
## Session 1:
BEGIN;
select room id from rooms where room id = 1 for update;
## Session 2:
BEGIN
use training;
delete from rooms where room_id = 2;
delete from rooms where room id = 1;
-- transaction waiting
## Session 3:
SELECT waiting_trx_id, waiting_pid, waiting_query, blocking_trx_id,
blocking pid, blocking query FROM sys.innodb lock waits;
## Session 1:
COMMIT;
## Session 2:
## See what happens
```

sys (Database included since MariaDB 10.6 AFAIK)

show innodb locks with sys

SELECT waiting_trx_id, waiting_pid, waiting_query, blocking_trx_id, blocking_pid, blocking_query
FROM sys.innodb_lock_waits;

Formatierung Ausgaben / Funktionen

Datumsausgabe formatieren

• https://mariadb.com/kb/en/date_format/

Strings zusammenfügen

• https://mariadb.com/kb/en/concat/

Partitions

Maintain Partitions and Explain

Walkthrough

```
##
## EXPLAIN PARTITIONS
##
DROP TABLE IF EXISTS audit log;
CREATE TABLE audit_log (
 yr YEAR NOT NULL,
 msg VARCHAR(100) NOT NULL)
ENGINE=InnoDB
PARTITION BY RANGE (yr) (
 PARTITION pO VALUES LESS THAN (2010),
 PARTITION p1 VALUES LESS THAN (2011),
 PARTITION p2 VALUES LESS THAN (2012),
 PARTITION p3 VALUES LESS THAN MAXVALUE);
INSERT INTO audit log(yr,msg) VALUES (2005,'2005'),(2006,'2006'),(2011,'2011'),
(2020, '2020');
EXPLAIN PARTITIONS SELECT * from audit_log WHERE yr in (2011,2012) \G
```

Example with years

```
CREATE TABLE audit_log2 ( yr YEAR NOT NULL, msg VARCHAR(100) NOT NULL)

ENGINE=InnoDB PARTITION BY RANGE (yr) ( PARTITION p2009 VALUES LESS THAN (2010),

PARTITION p2010 VALUES LESS THAN (2011), PARTITION p2011 VALUES LESS THAN (2012),

PARTITION p_current VALUES LESS THAN MAXVALUE);

INSERT INTO audit_log2(yr,msg) VALUES (2005,'2005'),(2006,'2006'),(2011,'2011'),

(2012,'2012');

EXPLAIN PARTITIONS SELECT * from audit_log2 WHERE yr = 2012;

ALTER TABLE audit_log2 REORGANIZE PARTITION p_current INTO (
    PARTITION p2012 VALUES LESS THAN (2013),
    PARTITION p_current VALUES LESS THAN MAXVALUE);
)

-- Where is data now saved

EXPLAIN PARTITIONS SELECT * from audit_log2 WHERE yr = 2012;
```

Eine bestehende große Tabelle partitionieren (mariadb)

```
Variante 1:
## Wichtig vorher Daten sichern

ALTER TABLE `audit_log3` PARTITION BY RANGE (`yr`) ( PARTITION p2009 VALUES LESS THAN (2010) ENGINE=InnoDB, PARTITION p2010 VALUES LESS THAN (2011) ENGINE=InnoDB, PARTITION p2011 VALUES LESS THAN (2012) ENGINE=InnoDB, PARTITION p2012 VALUES LESS THAN (2013) ENGINE=InnoDB, PARTITION p_current VALUES LESS THAN MAXVALUE ENGINE=InnoDB)

Variante 2:
Daten ausspielen ohne create (dump) + evtl zur sicherheit Struktur-Dump Tabelle löschen
Daten ohne Struktur einspielen
```

Ref:

• https://mariadb.com/kb/en/partition-maintenance/

Performance

* vs. specific field in field list - select

```
## You need to set up contributions database to test that
use contributions

## Variant 1: ALL Fields

mysql> select * from contributions limit 0,100000
100000 rows in set (0.25 sec)

## Variant 2: Specific field
## Try this multiple times, because the first time it is not
## in the innodb buffer (cache)

mysql> select vendor_last_name from contributions limit 0,100000;
100000 rows in set (0.04 sec)

## Result: Variant 2 wins over Variant 1
## The difference between these 2 is factor 5x in my case
```

Möglichst keine Funktion in where (spalte) verwenden

```
## Bad for performance
## Bad
## Good
```

SQL-Rewrite Pager- Subselect

```
explain SELECT film id, description FROM sakila.film ORDER BY title LIMIT 50, 5;

Analyzing Slow Queries / Indexes

Create unique index

CREATE UNIQUE INDEX HomePhone ON Employees(Home_Phone);

Find indexes

Show index from table

```
create database showindex;
use showindex;
CREATE TABLE `people` (
    id` int(10) unsigned NOT NULL AUTO_INCREMENT,
    ifirst_name` varchar(25) DEFAULT NULL,
    last_name` varchar(25) DEFAULT NULL,
    passcode` mediumint(8) unsigned DEFAULT NULL,
    primary Key ('id'),
    UNIQUE Key 'idx_passcode` ('passcode`),
    Key `idx_first_name_last_name` ('first_name`, 'last_name`)
) ENGINE=InnoDB DEFAULT CHARSET=latin1
show index from people
```

Show create table

```
show create table peple
```

show index from

```
show index from contributions
```

Create Index/Delete/Drop Index

create index idx_vendor_state on contributions (vendor_state);

Drop/Delete Index

drop index idx_last_name_first_name on customer;

Indizes

Avoid ALL

• is the worst type: TABLE SCAN (Need to go through all rows)

Cover Index.

• We can get all the necessary information from the index (no acces of filesystem necessary)

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx actor2 last name on actor2 (last name);
## using index
## <- indicates that a cover index is used
mysql> explain select last name from actor2 where last name like 'B%';
+---+
-----+
| id | select type | table | partitions | type | possible keys | key
| key len | ref | rows | filtered | Extra
                             +---+
-----+
| 1 | SIMPLE | actor2 | NULL | range | idx actor2 last name |
idx_actor2_last_name | 182 | NULL | 22 | 100.00 | Using where; Using index |
1 row in set, 1 warning (0.00 sec)
```

Creating a primary index

```
create index primary key on actor2 (actor_id)
explain select actor_id from actor2 where actor_id > 2
```

Using an index for last_name

Never use a function in where

Why?

```
Step 1: MySQL needs to retrieve every row
Step 2: run function
--> so, no index can be used
```

Example

```
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_last_name on actor2 (last_name);
explain select * from actor2 where last_name like
concat(substring(first_name,1,1),'%');
```

Index is always read from left to right

```
## so the index cannot be used if we ask for last_name
drop table if exists actor2;
create table actor2 as select * from actor;
create index idx_actor2_first_name_last_name on actor2 (first_name,last_name);
explain select * from actor2 where last_name like 'B%';
##
explain select * from actor2 where first_name like 'B%';
```

Explain

Einfacher Fall

```
explain select \star from actor
```

Erweiterter Fall

```
explain extended select * from user
show warnings
```

Anzeigen der Partitions

```
explain partitions select * from actor
```

Ausgabe im JSON-Format

```
## Hier gibt es noch zusätzliche Informationen explain format=json select * from actor
```

explain format=json SELECT a.first_name, a.last_name, fa.film_id FROM film_actor2 fa
INNER JOIN actor2 a ON fa.actor_id = a.actor_id

What does type say?

• https://mariadb.com/kb/en/explain/

profiling-get-time-for-execution-of.query

• Get better values, how long queries take

Example

```
set profiling = 1
-- Step 2 - Execute query
select last name as gross from donors where last name like lower('WILLI%')
## Step 3 - Show profiles
show profiles;
| Query_ID | Duration | Query
+-----
    1 | 0.01993525 | select last name as gross from donors where last name like
lower('WILLI%')
4 rows in set, 1 warning (0.00 sec)
## Step 4 - Show profile for a specific query
mysql> show profile for query 1;
+----+
             | Duration |
l Status
+----+
| starting
         | 0.000062 |
| checking permissions | 0.000006 |
| init
              | 0.000017 |
| end
             | 0.000005 |
| query end
             | 0.000008 |
15 rows in set, 1 warning (0.00 sec)
```

Kein function in where verwenden

1. No function in where (column_name)

```
## Never use a function for the column name in where
## e.g.
select * from donors where upper(last_name) like 'Willia%'
```

Why?

• Not index can be used

Optimizer-hints (and why you should not use them)

Tell the optimizer what to do and what not to do

 $\bullet \ \ \, \underline{https://dev.mysql.com/doc/refman/5.7/en/optimizer-hints.html\#optimizer-hints-syntax}$

This one is good for debugging / do not use index at all

explain select vendor_city from contributions use index() where vendor_city like 'S%'

Query-Plans aka Explains

- Query Plans are the same as Query Execution Plans (QEP's)
- You will see the Query Plan's with explain

Example

Output-Format json

```
-- includes costs

EXPLAIN format=json SELECT * from audit_log WHERE yr in (2011,2012);
```

Select_Type

• simple = one table

Types (in order of performance

system

```
Only one row in table is present (only one insert)
```

Query Pläne und die Key-Länge

Example

```
select table schema, table name, character set name, column name from
information schema.columns where table name = 'donors'
and column name = 'city';
| table_schema | table_name | character_set_name | column_name |
+----+
| contributions | donors
                 | utf8
                               | city
+-----
1 row in set (0.00 sec)
mysql> describe donors;
+----+
            | Type | Null | Key | Default | Extra
+----+
            | int(11) | NO | PRI | NULL | auto_increment |
| donor id
          | last name
| first_name
            | varchar(35) | YES |
| address 1
                              | NULL
                                    | varchar(36) | YES | | NULL |
| address_2
            | varchar(20) | YES | MUL | NULL |
| city
          | varchar(15) | YES | | NULL |
| varchar(11) | YES | | NULL |
| varchar(70) | YES | | NULL |
state
| zip
| employer
                             | NULL |
occupation | varchar(40) | YES | | NULL |
| last_name_reversed | varchar(70) | YES | MUL | NULL
11 rows in set (0.00 sec)
\#\# only the first part of the combined index is used, because 213 bytes is a
varchar(70) for utf8 - characters in index
## utf8 takes up to 3 bytes per character.
mysql> explain select first name, last name from donors where last name like 'Wi%';
+---+
---+----+
| id | select type | table | partitions | type | possible keys
| key_len | ref | rows | filtered | Extra
+---+
| 1 | SIMPLE | donors | NULL | range | donors donor info |
+---+
---+-----
1 row in set, 1 warning (0.00 sec)
## both last_name and first_name are used to filter
## 3 bytes + 70x3 (varchar(70)) + 3Bytes + 35x3 (varchar(35)) = 321
mysql> explain select first_name,last_name from donors where last_name like 'Williams'
and first name like 'A%';
```

Index und Likes

1. like 'Will%' - Index works

explain select last_name from donors where last_name like 'Will%';

2. like '%iams' - Index does not work

```
-- because like starts with a wildcard explain select last_name from donors where last_name like '%iams';
```

3. How to fix 3, if you are using this often?

```
## Walkthrough
## Step 1: modify table
alter table donors add last_name_reversed varchar(70) GENERATED ALWAYS AS
(reverse(last_name));
create index idx_last_name_reversed on donors (last_name_reversed);

## besser - Variante 2 - untested
alter table donors add last_name_reversed varchar(70) GENERATED ALWAYS AS
(reverse(last_name)), add index idx_last_name_reversed on donors (last_name_reversed);

## Step 2: update table - this take a while
update donors set last_name_reversed = reversed(last_name)
## Step 3: work with it
select last_name,last_name_reversed from donor where last_name_reversed like
reverse('%iams');
```

Version 2 with pt-online-schema-change

Index und Joins

Take a look which order the optimizer uses

With date

```
-- Using a date which has no index
-- Needs to do a table scan
explain select c.* from contributions c join donors d using (donor id) join recipients
r using (recipient id) where c.date recieved > '1999-12-01' and c.date recieved <
+---+
+-----
| id | select_type | table | partitions | type | possible_keys
key_len | ref | rows | filtered | Extra
                                             | key
key len | ref
                                            +---+
+----+
| 1 | SIMPLE | c | NULL | donor_idx,recipient_idx | NULL |
                       | 2028240 | 11.11 | Using where |
NULL | NULL
| 1 | SIMPLE | r | NULL | eq_ref | PRIMARY | PRIMARY |
4 | contributions.c.recipient_id | 1 | 100.00 | Using index |
| 1 | SIMPLE | d | NULL | eq_ref | PRIMARY | PRIMARY | 4 | contributions.c.donor_id | 1 | 100.00 | Using index |
+---+
+----+
3 rows in set, 1 warning (0.00 sec)
60626 rows in set (7.22 sec)
```

With date and filter on donor

```
explain select c.*,d.last name from contributions c join donors d using (donor id)
join recipients r using (recipient id)
where c.date_recieved > '1999-12-01' and c.date_recieved < '2000-07-01' and
d.last name like 'A%';
+---+
| id | select_type | table | partitions | type | possible keys
| key len | ref
                        | rows | filtered | Extra
----+
| 1 | SIMPLE | d | NULL | range | PRIMARY, donors_donor_info |
donors_donor_info | 213 | NULL
                              | 65894 | 100.00 | Using
where; Using index |
               | 1 | SIMPLE | c
donor_idx
          | 5 | contributions.d.donor_id | 2 | 11.11 | Using
          | 1 | SIMPLE | r | NULL | eq_ref | PRIMARY
                                               | PRIMARY
| 4 | contributions.c.recipient id | 1 | 100.00 | Using index
```

With date and filter on donor, less specific

```
select c.*,d.* from contributions c join donors d using (donor id) join recipients r
using (recipient id) where c.date recieved > '1999-12-01' and c.date recieved < '2000-
07-01' and d.last name like 'A%';
explain select c.*,d.* from contributions c join donors d using (donor_id) join
recipients r using (recipient id) where c.date recieved > '1999-12-01' and
c.date recieved < '2000-07-01' and d.last name like 'A%';</pre>
+---+
-----
| id | select_type | table | partitions | type | possible_keys
+---+
| 1 | SIMPLE | d | NULL | range | PRIMARY, donors_donor_info |
donors_donor_info | 213 | NULL
                                  | 65894 | 100.00 | Using
index condition |
| 1 | SIMPLE | c | NULL | ref | donor_idx,recipient_idx |

```

Find out cardinality without index

Find out cardinality without creating index

```
select count(distinct donor_id) from contributions;

select count(distinct(vendor_city)) from contributions;
+------+
| count(distinct(vendor_city)) |
+------+
| 1772 |
+------+
1 row in set (4.97 sec)
```

Index and Functions

No index can be used on an index:

Workaround with virtual columns (possible since mysql 5.7)

```
## 1. Create Virtual Column with upper
alter table sakila add idx_last_name_upper varchar(45) GENERATED ALWAYS AS
upper(last_name);
## 2. Create an index on that column
create index idx_last_name_upper on actor (last_name_upper);
```

Workaround with persistent/virtual columns (MariaDB)

```
mysql> alter table actor add column last_name_upper varchar(45) as (upper(last_name))
PERSISTENT;
mysql> insert into actor (first_name,last_name,last_name_upper) values
('Max','Mustermann','MUSTERMANN');
mysql> select * from actor order by actor_id desc limit 1;
mysql> -- setting index
mysql> create index idx_last_name_upper on actor (last_name_upper);
Query OK, 0 rows affected (0.007 sec)
Records: 0 Duplicates: 0 Warnings: 0
mysql> -- to use index we need to avoid the function in where
mysql> explain select * from actor where last_name_upper like 'WI%' \G
```

Index neu aufbauen?

```
## Aus meiner Sicht sollte das auch so für die aktuelle MariaDB Version 10.6 gelten
For basic cleanup and re-analyzing you can run "OPTIMIZE TABLE ...", it will compact
```

out the overhead in the indexes and run ANALYZE TABLE too, but it's not going to resort them and make them as small & efficient as they could be.

https://dev.mysql.com/doc/refman/8.0/en/optimize-table.html

However, if you want the indexes completely rebuilt for best performance, you can:

drop / re-add indexes (obviously)
dump / reload the table
ALTER TABLE and "change" using the same storage engine
REPAIR TABLE (only works for MyISAM, ARCHIVE, and CSV)
https://dev.mysql.com/doc/refman/8.0/en/rebuilding-tables.html

If you do an ALTER TABLE on a field (that is part of an index) and change its type, then it will also fully rebuild the related index(es).

Index Stats

General

```
Index stats where introduced in MariaDB 10.4
(These can be used by the query optimizer)
Before that only indexes were used,
now it is also possible these stats into account
The stats are saved in the mysql-database
mysql.column stats
mysql.table stats
mysql.index stats
These are histogramm stats,
they are used automatically from 10.4.1 on,
but they are not created automatically.
You have to perform an operation which is
cost intensive to create them, because a full
table scan is done.
These stats are
Engine-independent Statistics
```

Notes

- Stats are currently used (MariaDB 10.6) by default because of setting
 - show variables like 'use_stat_tables'
 - -> preferably_for_queries
- But: They are not created automatically (see Howto how to do that)
- Also: They are not deleted automatically

Howto

```
use mysql;
select * from column_stats;
select * from index_stats;
select * from table_stats;
use contributions;
ANALYZE TABLE contributions PERSISTENT FOR ALL;

use mysqL;
select * from column_stats;
select * from index_stats;
select * from table_stats;
```

When will it be used?

2021-08-11: Looks like it is currently used for range-scan for the optimizer, which table to start with

An excessive example can be found here:

Tools

Percona Toolkit

Walkthrough (Ubuntu 20.04)

```
## Howto
## https://www.percona.com/doc/percona-toolkit/LATEST/installation.html

## Step 1: repo installieren mit deb -paket
wget https://repo.percona.com/apt/percona-release_latest.focal_all.deb
apt update
apt install -y curl
dpkg -i percona-release_latest.focal_all.deb
apt update
apt install -y percona-toolkit
```

Walkthrough (Debian 10)

```
sudo apt update
sudo apt install -y wget gnupg2 lsb-release curl
cd /usr/src
wget https://repo.percona.com/apt/percona-release_latest.generic_all.deb
dpkg -i percona-release_latest.generic_all.deb
apt update
apt install -y percona-toolkit
```

sudo apt update; sudo apt install -y wget gnupg2 lsb-release curl; cd /usr/src; wget
https://repo.percona.com/apt/percona-release_latest.generic_all.deb; dpkg -i perconarelease_latest.generic_all.deb; apt update; apt install -y percona-toolkit

pt-query-digest - analyze slow logs

Requires

• Install percona-toolkit

Usage

```
## first enable slow_query_log
set global slow_query_log = on
set global long_query_time = 0.2
## to avoid, that i have to reconnect with new session
set session long_query_time = 0.2

## produce slow query - for testing
select * from contributions where vendor_last_name like 'W%';
mysql > quit

##
cd /var/lib/mysql
## look for awhile wih -slow.log - suffix
pt-query-digest mysql-slow.log > /usr/src/report-slow.txt
less report-slow.txt
```

pt-online-schema-change howto

Requirements

• Install percona-toolkit

Documentation

• https://www.percona.com/doc/percona-toolkit/3.0/pt-online-schema-change.html

What does it do?

```
## Altering table without blocking them
## Do a dry-run beforehand
pt-online-schema-change --alter "ADD INDEX idx_city (city)" --dry-run
D=contributions,t=donors
##
pt-online-schema-change --alter "ADD INDEX idx_city (city)" --execute
D=contributions,t=donors
```

With foreign - keys

```
# first try
pt-online-schema-change --alter "add column remark varchar(150)" D=sakila,t=actor --
alter-foreign-keys-method=auto --dry-run
# then run
pt-online-schema-change --alter "add column remark varchar(150)" D=sakila,t=actor --
alter-foreign-keys-method=auto --execute
```

Example sys-schema and Reference

Ref:

• https://github.com/mysql/mysql-sys/blob/master/README.md

Profiling

Example

```
MariaDB [(none)]> SET profiling = 1;
Query OK, 0 rows affected (0.000 sec)
MariaDB [(none)]> select * from actor where last name like 'D%';
ERROR 1046 (3D000): No database selected
MariaDB [(none)]> use sakila;
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A
Database changed
MariaDB [sakila] > select * from actor where last name like 'D%';

MariaDB [sakila]>
```

* Backup und Restore

Backup und Restore

```
mysqldump sakila > /usr/src/sakila.sql
mysql sakila < /usr/src/sakila.sql
echo "show tables;" | mysql sakila;

##echo "create schema verleih;" | mysql
## oder
mysql -e 'create schema verleih'
mysql verleih < /usr/src/sakila.sql</pre>
```

Tipps & Tricks

Dummy table DUAL

• https://mariadb.com/kb/en/dual/

Wie kann ich verwendete Storage Engine rausfinden - Table

use sakila;
show create table actor;

SHOW VARIABLES WITH WHERE

SHOW VARIABLES WHERE VARIABLE_NAME like '%slow%' OR VARIABLE_NAME LIKE '%long%'

Schnellster Import von Daten mit csv

Example

```
LOAD DATA INFILE '/tmp/test.txt' INTO TABLE test

FIELDS TERMINATED BY ',' LINES STARTING BY 'xxx';

LOAD DATA INFILE 'data.txt' INTO TABLE tbl_name

FIELDS TERMINATED BY ',' ENCLOSED BY '"'

LINES TERMINATED BY '\r\n'

IGNORE 1 LINES;
```

General/Ref

- Is the quickest way
- Performance Ref: https://jynus.com/dbahire/testing-the-fastest-way-to-import-a-table-into-mysql-and-some-interesting-5-7-performance-results/

Queries in Datenbank (mysql) loggen, die keine Indizes verwenden

```
-- long_query_time can auf 10 sec bleiben
SET GLOBAL log_queries_not_using_indexes = 1;
SET GLOBAL log_output = 'TABLE';
-- last setting
SET slow_query_log = 1;
```

Workaround Materialized View

```
CREATE EVENT `tr_sakila_aggregate`

ON SCHEDULE

EVERY 1 MONTH STARTS '2021-08-12 11:20:00'

ON COMPLETION PRESERVE

ENABLE

COMMENT 'Simulation Materialized View (Light)'

DO BEGIN

DROP TABLE IF EXISTS sakila_aggregate;

CREATE TABLE sakila_aggregate AS SELECT actor_id,last_name,first_name FROM actor

WHERE actor_id > 200;

END
```

Zeichensatz umstellen

Example (if it works it is great)

```
-- Do this for every table

ALTER TABLE Tabellenname CONVERT TO CHARACTER SET utf8 COLLATE utf8_general_ci

ALTER DATABASE Datenbankname DEFAULT CHARACTER SET utf8 COLLATE utf8_general_ci
```

Settings des und des Clients herausfinden

```
## im mysql
mysql>status;

## mit sql z.B. heidisql
show variables like '%char%';
```

Oracle

Activating Oracle Sql-Mode

```
## ACTIVATE GLOBALLY (for complete server) - not persistent
## if you want to activate it globally
## this will not be available in the current session though
mysql>SET GLOBAL sql_mode='ORACLE'
mysql> SELECT @@GLOBAL.sql_mode -- available globally
mysql> SELECT @@sql_mode -- in session. not present yet.

## FOR THE session to be active, either reconnect or set it explicitly
mysql>SET sql_mode='ORACLE'
mysql>SELECT @@sql_mode
```

Overview Oracle Mode

Working with database objects

Working with databases

Explanations

```
## open a connection to the mysql-server by entering
mysql
## then you will get
mysql>

## Comments within mysql-client
## three - in a row
---
```

Create database

```
create database training create schema training2
```

Show databases

```
mysql
mysql>
;; from here i leave out mysql>
;; so you can easily copy & paste the lines hereafter
show databases
--
-- or
--
show schemas
--
```

```
-- or by using information_schema
--
select * from information_schema.schemata;
```

Working with tables

Show tables

```
## within mysql>
## so on the command-line enter:
## mysql (as root)
USE sakila
SHOW TABLES
-- or --
select * from information_schema.TABLES
```

Create table

```
-- only if you want to create table in a completely new database create schema training;
USE training
CREATE TABLE people (id INT NOT NULL AUTO_INCREMENT, name VARCHAR(20), PRIMARY KEY(id));
```

Find out the structure of the table

```
## you have to connect to db first with
## mysql
## within mysql>
DESCRIBE people
SHOW CREATE TABLE people
-- or : if you want to know more --
SELECT * from INFORMATION_SCHEMA.COLUMNS WHERE TABLE_NAME='people' AND
TABLE_SCHEMA='training' \G
```

Show indexes

```
SHOW INDEX FROM actor
SHOW INDEXES FROM ACTOR
```

Change table (Add field)

```
--- We want to add a field before name
--- IMPORTANT: BEFORE does not exist
ALTER TABLE people ADD first_name VARCHAR(10) AFTER id;

ALTER TABLE schulungen ADD seats TINYINT unsigned DEFAULT 1, ADD price DECIMAL(6,2);
ALTER TABLE schulungen ADD (room TINYINT unsigned DEFAULT 1, discount DECIMAL(6,2));
```

Modify a field in table (Change property)

```
ALTER TABLE people

MODIFY COLUMN first_name VARCHAR(20);
```

Drop a field from the table

```
ALTER TABLE people ADD middle_name VARCHAR(25) BEFORE name;

DESCRIBE people;

ALTER TABLE people DROP COLUMN middle_name;

## More Examples
--

ALTER TABLE actor ADD in_rente BOOLEAN default true

INSERT INTO actor (first_name, last_name, in_rente) values ('Jochen', 'Metzger', false)
-- Wieder loswerden

ALTER TABLE actor DROP in_rente;

## add and drop in once command

ALTER TABLE actor ADD in_rente2 BOOLEAN default true, DROP in_rente;
```

Deleting table data (truncate)

```
USE sakila
-- Create table based on other table

CREATE TABLE actorcopy as SELECT * FROM actor;
-- Fields ?

SELECT * FROM actorcopy;
-- Empty it

TRUNCATE TABLE actorcopy;
-- Emptry ?

SELECT COUNT(*) FROM actorcopy;
```

Delete table data (with delete)

Explanation

- Do not use delete when you want to use data of complete table
 - truncate is quicker in this case.
- DELETE FROM ... WHERE ... does a SELECT first

Example

```
USE sakila

CREATE TABLE actorbackup AS SELECT * FROM actor;

SELECT COUNT(*) FROM actorbackup;

DELETE FROM actorbackup WHERE actor_id > 100;

SELECT COUNT(*) FROM actorbackup;
```

Delete complete table

```
USE sakila
DROP TABLE actorbackup;
```

Teststellung - Feld verkleinern

```
ALTER TABLE actor ADD filme tinyint unsigned default 255;

-- Does not work

-- UPDATE actor SET filme = 256 WHERE actor_id = 1;

-- ALTER TABLE actor MODIFY filme smallint unsigned default 256;

INSERT INTO actor (first_name, last_name) values ('Gaucho', 'Poncho');

INSERT INTO actor (first_name, last_name, filme) values ('Gauchina', 'Ponchina', 32000);

-- Does not work

ALTER TABLE actor MODIFY filme tinyint unsigned;
```

SELECT

Select Beispiele

Einfaches Beispiel (bestimmte Felder)

```
## Zeige alle diese felder aus dieser Tabelle
SELECT <welche_feld_mit_komma_getrennt> FROM <welche tabelle>
-- bitte datenbank sakila verwenden
use sakila
-- zeige actor_id, last_name
SELECT actor_id, last_name FROM actor
```

Einfaches Beispiel (alle Felder)

```
-- bitte datenbank sakila verwenden
use sakila
-- zeige actor_id, last_name
SELECT * FROM actor
```

Einfaches Beispiel mit Bedingung

```
-- SYNTAX
use sakila;
-- SELECT <welche_felder> FROM <welche_tabelle> WHERE
<wo_welches_feld_welchen_wert_hat>
-- Beispiel 1
SELECT actor_id, last_name FROM actor where actor_id = 5;
-- Beispiel 2
SELECT * FROM actor where actor_id = 5;
```

Einfache Bedingung mit Bereich(en)

```
-- SYNTAX
use sakila;
-- SELECT <welche_felder> FROM <welche_tabelle> WHERE
<wo_welches_feld_welchen_wert_hat>
-- Beispiel 1
SELECT actor_id, last_name FROM actor where actor_id > 8;
-- Beispiel 2
SELECT * FROM actor where actor_id > 8;
-- Beispiel 3
SELECT * FROM actor where actor_id > 8 and actor_id < 50;
```

Zwei Bereiche abfragen

```
## Brackets are not necessary, works the same
select * from actor where (actor_id >= 8 and actor_id <=50) or (actor_id >= 100 and
```

Select Beispiele mit Like

Hintergrund Platzhalter '%' und '_'

• https://elearn.inf.tu-dresden.de/sqlkurs/lektion01/01_07_03_einschr_like.html

Name fängt mit J an

```
## Alle Datensätze, die mit J anfangen
select first_name,last_name from actor where last_name like 'j%'
## mit ausgabe zusätzlichem String
select first_name,last_name,' ist der/die Beste' as bewertung from actor where
last_name like 'j%'
```

Name hört mit n auf

```
select first_name, last_name from actor where last_name like '%n'
```

Name beinhaltet 'q'

```
select first_name,last_name from actor where last_name like '%q%'
```

Platzhalter für genau ein Zeichen (Linux/Windows -> ?)

```
## Alle Zeilen mit Last name McQ, dann genau einem beliebigen Zeichen und dann 'een'
SELECT * FROM sakila.actor where last name like 'McQ een'
```

SELECT ORDER BY

Syntax

```
-- Variante 1: (ohne where)
-- SELECT * FROM <welche_tabelle> ORDER BY <welches_feld>
-- Variante 2: (mit where)
-- SELECT * FROM <welche_tabelle> WHERE <welche_bedingung> ORDER BY <welches_feld>
```

Beispiel ohne where

```
## feld aufsteigend
SELECT last_name, first_name, actor_id FROM sakila.actor ORDER BY last_name

## feld absteigend
SELECT last_name, first_name, actor_id FROM sakila.actor ORDER BY last_name desc

## erstes feld aufsteigend, zweites feld absteigend
SELECT last_name, first_name, actor_id FROM sakila.actor ORDER BY last_name, first_name
DESC
```

Beispiel mit where

SELECT last_name,first_name,actor_id FROM sakila.actor WHERE last_name like 'J%' ORDER BY last_name ASC,first_name DESC

Unterschiede einfache und doppelte Hochkommas bei Oracle/MySQL

MySQL

```
Hochkommas werden nur bei der Abfrage des Wertes verwendet, z.B

select * from actor where last_name like 'A%'

## das ist das gleiche wie:
select * from actor where last_name like "A%"
```

MySQL - Wann nehme ich einfache, wann doppelte?

```
## z.B. wenn ich ein Hochkomma in der Abfrage brauche, z.B
## damit besser lesbar für Admin/Entwickler
select * from actor where last_name like "O'Connor"
## Alternativ geht auch:
## Verfahren: Escapen
select * from actor where last_name like 'O\'Connor'
```

Oracle:

```
## Für Feldname und Ausgabe Feldname (Alias) Doppelte hochkommas.
## z.B
## Hier immer das doppelte Hochkomma, weil es um den Identifier/Bezeichner geht
SELECT 'Hello, world!' AS "My Greeting"

### Für String und Date - Werte einfache Hochkommas
select * from actor where last_name like 'A%'
```

INSERT/UPDATE

Praktisches Beispiel und erweitertes insert - INSERT

Beispiel

```
INSERT INTO actor (first_name, last_name) values ('Joe','Manchos');
```

Erweitertes Insert

```
## Mehrere Wertepaare einfügen - geht schneller als einzelne Inserts
INSERT INTO actor (first_name,last_name) values ('Joe','Metzgeros'),
('Hans','Mustermann');
```

Referenz

• https://www.w3schools.com/sql/sql_insert.asp

Praktisches Beispiel - Update

Einfaches Beispiel ein Datensatz ändern

```
## Variante 1
UPDATE actor SET last_name = 'GUINESSA' WHERE actor_id = 1
## Variante 2 - 2 Felder ändern
UPDATE actor SET first_name='PENELOPEZ',last_name = 'GUINESS' WHERE actor_id = 1
```

Referenz

• https://www.w3schools.com/sql/sql_update.asp

DELETE

Einfaches Delete Beispiel

Example

DELETE FROM actor WHERE id = 200

Reference

• https://www.mysqltutorial.org/mysql-delete-statement.aspx

Datentypen

Integer - INT - Datentypen

Reference

• https://dev.mysql.com/doc/refman/8.0/en/integer-types.html

Basics

Connection to DB + exit

General Explanation

- Step 1: connection to db
- Step 2: using specific database
- 1. 2. can be done in one step

Connection as Root (without using -u/--user and db)

```
## If you are root and are connecting locally (socket), you do not need to enter a
passwort on root
## Why ?
mysql> use mysql
mysql> select user,host,plugin from user where user = 'root' and host = 'localhost';

root@mysql-server:~#whoami
root
## this work, because we are connecting locally
## by default mysql uses the user we are logged in with
mysql
```

Connection with credentials

```
mysql -uroot -p
## passwort auf der Kommandozeile eingeben
```

Connection to remote mysql - server

```
mysql -u root -p -h 10.10.9.117
```

mysql-client

Basics

```
mysql
mysql>
## Wie kommen wie raus ?
exit;
```

Delimiter

```
Normalerweise ";"

Ist zum Trennen von Befehlen
```

Use user and password automatically

```
nano /root/.my.cnf
## BE CAREFUL EVERYBODY CAN LOGIN AS ROOT TO MYSQL NOW
## in there
[mysql]
user=root
password=root-password-on-your-system
```

Charset-Collations

server system variablen abfragen

Storage Engines

Which engine is used

show variables like '%default%';

Working with the data modelling language (DML's)

Working with INSERT

```
## Always use the field-names
INSERT INTO actor (first_name, last_name) values ('John', 'Smith');

## Extended inserts are quick (better than single inserts)
INSERT INTO actor (first_name, last_name) values ('John', 'Peters'),
('Mandy', 'Johnsson');
```

Tipps & Tricks / Do Not

Dump/SQL-File einspielen auf der Kommandozeile - Windows

 $\label{local_mass} \verb|mysql -u root -p < C:\Users\Admin\Downloads\test.sql|\\$

Tools

HeidiSQL Portable - works for windows

Tipps & Tricks

Best Practice DBAL - Kochrezept

Ausgangsituation

```
DBAL erstellt query
Query ist langsam
Was tun ?
```

Steps 1+2

```
### An das SQL-Statement rankommen.
\#\#\# 1. Analyse, warum ist Query langsam (kann ich von aussen etwas tun, um die Query
zu beeinflussen ohne sie zu ändern
explain <sql-statement>
### Sichtprüfung, fehlen Keys ??
##explain select vendor_city, vendor_state from contributions where vendor_first_name
like 'D%';
##+---+
---+----+
key_len | ref | rows | filtered | Extra |
##+---+
---+----+
##| 1 | SIMPLE | contributions | NULL | ALL | NULL | NULL | NULL
| NULL | 2028402 | 11.11 | Using where |
##+----+
---+----+
## Gibt es bei dem type einen Eintrag ALL.
### Oder da ist ein key drin, aber der wird garnicht verändert.
### Index setzen
```

Step 3.

```
Query analysieren -> Schritt debuggen.

1) Links -> Rechts: Entweder von Links (sprich: was sind die ersten Daten, die ich brauche, welche dann, welche dann usw.)
```

2) Rechts \rightarrow Links \rightarrow immer mehr wegnehmen und gucken, ob es schneller wird.

Step 4:

index hint.

Step 5: Customized Query

Übungen

Übung Update/Insert

```
1. In einer Anweisung alle Datensätze ändern in denen der erste Name JUDY und der
Nachname DEAN ist -> dort Vorname in JAMES ändern.

UPDATE actor SET first_name = 'JAMES' where last_name='DEAN' and first_name='JUDY';

2. In einem SQL-Statement 2 neue Datensätze einfügnen. 1. Mann, Josef 2. Mannheim,
Martha

INSERT INTO actor (first_name, last_name) values ('Mann','Josef'),
('Mannheim','Martha');
```
